CA-IR-221

Ref: HECO T-9, page 17 (CIS Project Costs and Benefits).

Please provide, in electronic Excel format and hard copy, the following documents that have been prepared by or for HECO to evaluate and compare the CIS project costs to anticipated benefits:

a. The initial overall economic analyses prepared for presentation to the Commission in support of HECO's application for approval of the CIS project.
b. Each economic analysis prepared after the initial application to the Commission that was subsequently presented to the commission in either detailed or summary form.
c. The most recent available economic analysis prepared for the use of Company management to evaluate how project costs and benefits have changed as a result of project delays and cost increases that have occurred.

HECO Response:

a. As noted in the Company's response to CA-IR-145, a copy of the business case analysis of the CIS project was filed as Exhibit A, "Customer Information System Assessment and Recommendation for Hawaiian Electric Company", of the Company's Application in Docket No. 04-0268 ("CIS Docket"), filed August 26, 2004 (see Attachment 1). Also, Attachment 2 is a hard copy of the underlying quantitative basis for Attachment 1 (an electronic file of Attachment 2 is also submitted with this response).

b. There were no further economic analyses prepared after the initial application to the Commission. As noted in the Company's response to CA-IR-145, the Company has filed updated functional requirements and cost of the CIS project in accordance with Decision and Order No. 21798 ("D&O 21798"), filed May 3, 2005, in the CIS Docket.[1] The Companies submitted the following project notification letters:,

[1] D&O 21798 required the Companies to file "notification letters with the commission and Consumer Advocate, if and when there is a significant change in either the functionality or cost of the Project, from the baseline functionality or cost resulting from the gap analysis, which will be conducted by the Utilities following the awarding of the contract. The term 'significant' as used in this paragraph, is defined as an increase or decrease in functionality beyond the functionality identified as a result of the gap analysis or an increase or decrease in the Project's projected costs (as stated in the Application or most recent estimate) of over five (5) percent."

- The CIS Interim Supplemental Report, filed on May 12, 2006
- The CIS Notification Letter, filed on April 25, 2007
- The CIS Notification Letter, filed on July 1, 2008

As discussed in Docket No. 04-0268, the existing CIS, ACCESS which was designed in the 1980's using technology originally dating back to the 1960's and implemented in 1991, was designed as a basic billing and meter data information system. While still operational, the existing CIS is outdated, many of its components (e.g., database structure, programming environments, operating systems, system hardware) are increasingly difficult to maintain, and the system cannot meet either current or future business needs. For example, the existing CIS does not fully support basic functions such as reporting of outages, calculating complex customer bills, evaluating customer credit and managing collections from customers. In addition, enhancements in customer service and billing, and the implementation of new systems, have exceeded ACCESS' capabilities, due to its technological and functional limitations.

There have been substantial advances in technology since the existing system was designed and implemented. The new CIS will allow HECO to more quickly and accurately store, maintain and manage customer-specific information necessary to provide basic customer service functions, such as producing bills, collecting payments, establishing service and fulfilling customer requests. The new CIS will also have substantially greater capabilities and features than the existing CIS, which will allow HECO to enhance customer service and operations. Such capabilities and features will enable HECO to: (1) update and modernize its customer service abilities by providing more extensive and complete information in a readily accessible format, which will facilitate the delivery of more timely

and responsive information and services, and better meet customer expectations and needs; (2) automate processes that are currently performed manually; (3) record, store, manage and access more customer data effectively; and (4) more easily integrate the new CIS with other systems.

c. See response to item b.

Attachments 1 and 2 are voluminous and available for inspection at HECO's Regulatory Affairs Division office, Suite 1301, Central Pacific Plaza, 220 South King Street, Honolulu, Hawaii. Please contact Dean Matsuura at 543-4622 to make arrangements to inspect the documents. Electronic copies of the requested information are being provided.

I. Introduction

Hawaiian Electric Company, Inc. ("HECO"), Hawaii Electric Light Company, Inc. ("HELCO"), and Maui Electric Company Limited ("MECO"), hereafter collectively referred to as "Hawaiian Electric" or the "Companies", consider it prudent business practice to periodically evaluate their systems and upgrade and/or replace any aging business equipment and systems as necessary rather than waiting until the equipment and systems can no longer meet customer and operational demands or support new services, products or offerings.

Consistent with this approach, in November of 2000, the Companies formed the Customer Information System Project Team ("CIS Project Team") to review the Companies' current aging customer information system ("CIS") known as the Automated Corporate Customer Energy Services System ("ACCESS"). The Companies commissioned an outside management consulting firm, Bass & Company[1], to lead the CIS Project Team. The initial study resulted in a presentation to point out several high-level limitations of ACCESS. A more detailed study was carried out in January 2003 that identified detailed customer and business requirements and measured ACCESS' ability to meet these and future needs.

This Report contains the findings and recommendations of the CIS Project Team.

II. Executive Summary

Over the last 30 years, utility CIS systems have evolved from custom-designed metering and billing applications to flexible and configurable, packaged customer management systems. This trend towards a "focus on the customer" has been enabled by an underlying evolution in technology and systems design. Utility CIS systems available on the market today in no way resemble systems designed and implemented as late as 10 years ago. From the user interface and available functionality to the underlying database and systems programming environment, current customer information systems have been designed to help utilities manage their operations and reporting requirements and to help their employees to provide better service and timely information to customers.

The Companies installed their first customer information system almost 30 years ago (1973-1974) in order to replace their manually intensive billing and accounting processes and to meet the needs of a customer base of about 242,000 accounts across the three Companies. Fourteen years later, in 1988, the Companies began the replacement of the first system with ACCESS to meet the additional demands of a customer base that had grown by nearly 34% to more than 324,000 over that period.[2]

[1] Bass & Company's profile is attached hereto as Attachment #1.

[2] ACCESS enabled the Companies to further automate more of their major processes. However, a good portion of the Companies operations still requires a HECO, HELCO or MECO employee to manually handle, track or otherwise intervene in order to successfully complete or manage customer or operations transactions.

© Copyright 2003 Bass & Company. Unpublished work. All rights reserved.

Once again, 16 years after the acquisition of ACCESS, not only has the customer base grown by nearly 29% to over 417,000, but advances in technology, enhancements in customer service and billing, and the implementation of new systems is exceeding the limits of ACCESS' aged technology and limited system functionality. Customer demands and expectations have also increased as industries and companies have incorporated technology to provide customers with more information, more services, more options, and more choices. The internet-era has ushered in customer expectations that could not have been predicted by the ACCESS programmers in the 1980's.

While ACCESS and the related hardware and software are still operational, the CIS Project Team found that ACCESS is nonetheless outdated, is increasingly difficult and costly to maintain, and does not meet current and future business needs.

For example, the ACCESS application development environment uses the COBOL programming language that was first introduced in 1959. Few recent graduates of computer science or management information system programs know the COBOL programming language. Hence, qualified candidates with these skills are becoming increasingly difficult and expensive to find and hire. Eventually, the Companies will be unable to recruit candidates with the background necessary to support ACCESS. Recent research highlights that the number of skilled COBOL developers is declining each year, as new applications replace COBOL-based systems.[3] Therefore, enterprises must develop a long-term strategy to migrate their COBOL based systems to new technologies.[4] The CIS Project Team noted many of the technological and functional limitations of ACCESS including:

- The Information Management System ("IMS") hierarchical database has been surpassed by relational databases, the COBOL and Assembler programming languages are becoming outdated, and the antiquated "green screen" user interface is challenging. Hawaiian Electric, despite its own internal capabilities, cannot confidently handle fundamental issues of this complexity.
- The ACCESS application cannot support many of Hawaiian Electric's current business and customer requirements. This lack of capability manifests itself in longer customer response time to customer inquiries, manual workarounds, and inadequate record keeping.
- ACCESS does not lay the groundwork for future business and customer needs. Without increased functionality, Hawaiian Electric will be unable to meet current customer expectations for service and information, not to mention the emerging demand for new products,

[3] "As COBOL developers retire, enterprises face the risk of losing specialists capable of maintaining these systems." per Application Development Skill and Technology Trends, Gartner Group, September 18, 2002.

[4] For example, the database structure (originally designed in the 1960's) is inflexible and difficult to modify, making it difficult to add, delete or change information fields to support the Companies' increasingly demanding customer and business needs. Current databases structures allow almost unlimited modifications, relational queries, and cross utilization among different programs with comparative ease.

© Copyright 2003 Bass & Company. Unpublished work. All rights reserved.

new options, and choices. Hawaiian Electric must address the CIS shortcomings or fall behind the industry in offering these options to customers.

The CIS Project Team, comprised of internal staff from all 3 operating companies and outside experts from Bass & Company, identified the technical and functional requirements of a customer information system capable of meeting the current and future needs of Hawaiian Electric and its customers. The CIS Project Team considered four alternatives to meet these requirements: (1) replace ACCESS with a new CIS through an outsourcing relationship with a third-party provider; (2) develop and implement a custom-built CIS; (3) make significant programming modifications to ACCESS; and (4) purchase a commercially available customer information system solution.

The CIS Project team performed a comprehensive and exhaustive analysis of each of these options. Of principal importance to the team was to:

- Quickly deliver functionality to meet current customer and user needs
- Minimize both short-term and long-term investment requirements
- Provide an upgrade path to meet future business needs

A comparison of the project team's findings of the four alternatives is found in the table below.

Alternative	Total 14 Year Cost (Selection, Installation + Maintenance)	Time to Complete	Percent of Requirements Fully Met	Net Present Value - Revenue Requirements
Outsourcing CIS	$48.4 - $88.2 m	.75 yrs	79%	$28.5 m
Internally Build CIS	$59.6 m	6 yrs	100%	$36.9 m
Modify ACCESS	$20.9 m	12 yrs	53%	$12.3 m
Purchase & Configure CIS	$31.4 m	2 yrs	87%	$23.8 m

The CIS Project Team recommends that the Companies choose Alternative 4, purchase a commercially available customer information system solution. This option provides Hawaiian Electric a complete customer information system solution at a reasonable cost and within a reasonable timeframe. Alternative 4 was considered the best combination of balancing risk and cost and technically sound solutions to the problems identified during the research process. The Project Team believes that a new CIS package will fully address current ACCESS limitations and resolve the majority of business requirements that were identified by the team. While cost was a significant consideration in making this recommendation, it was not the sole consideration. Other strategic issues ultimately led the team to this conclusion. In particular, the Team determined that modification of ACCESS will not sufficiently meet Hawaiian Electric's critical current needs, has an extremely long lead-time, and is subject to many implementation risks. These issues as well as others are

© Copyright 2008 Bass & Company. Unpublished work. All rights reserved.

identified and while not all quantifiable, are critical to the near and long-term success of any CIS option.

III. Scope of the Study

The CIS Project Team was tasked with assessing ACCESS' ability to meet current and future business needs and customer expectations. If the CIS Project Team concluded that ACCESS did not sufficiently meet the Companies present and future requirements, the CIS Project Team was tasked to evaluate various alternatives and recommend a course of action for the Companies.

A. Objectives

The CIS Project Team relied on the following objectives to guide its review of current and future CIS performance and to ensure consistency with the business objectives of the Companies:

- Meet current and future customer and business needs supported by the customer information system.
- Address the increasing obsolescence of the technology that underlies the current customer information system.
- Provide excellent customer service through well-planned and implemented technology and equipment investment.
- Support strategic customer and business initiatives.
- Utilize technology that provides customers with the opportunity for self-service and the information needed to make informed energy management decisions.
- Support future growth in system capacity, open connectivity, and varying degrees of automation for special applications while providing stability and reliability.
- Ensure interoperability across current and planned system initiatives to deliver enhanced information to Hawaiian Electric and its customers.

B. CIS Review Process

In order to determine what steps Hawaiian Electric needs to take to meet current and future business and customer needs, the CIS project team documented the requirements of all applicable business and functional units. The goal of the process was to determine:

- Current and future customer expectations

© Copyright 2008 Bass & Company. Unpublished work. All rights reserved.

- Current and future business needs related to the customer and CIS
- Current and future technical needs related to the customer and CIS

The CIS Project Team also researched current and anticipated utility and industry standards and practices. The team reviewed widely known industry studies, which further confirmed the team's finding and recommendations. As applicable, this research is noted in this summary.

To gather requirements, the CIS Project Team interviewed front-line and customer-facing employees, utilized customer transaction surveys, customer comments and customer complaint logs to validate customer expectations. The CIS Project Team researched customer expectations related to the electric utility industry and found that Hawaiian Electric's customer expectations were consistent with those of other utilities. The following customer expectations were outlined in a recent J.D. Power & Associates Residential Electric Utility Customer study[5]:

- Reliability: power quality; avoidance of spikes/surges and brief interruptions; upkeep of wires, poles, transformers; supply in extreme hot/cold; avoidance of lengthy outages; prompt restoration of electricity; reliable service; and information about outages.
- Billing: accuracy of meter read/amount to pay; quality of bill information; ease of finding amount to pay and ease of understanding bill; amount of time to pay; options for paying bill; and due date.
- Customer Assistance Center: Problem-solving skills; courtesy of representative; ability to listen; genuine concern; helpfulness; knowledge; ability to solve problem on first call; ability to deliver what is promised; promptness in speaking to representative; and convenient hours.
- Price & Value: value of electric service for amount you pay; total monthly cost; pricing fairness; willingness to help reduce cost; pricing options available; and ease of understanding pricing options.
- Company Image: reputation; honesty; efficiency efforts; communicates account change; offers variety of services/features; industry leader; community commitment; stand behind service; safety communications; plan future; environmental concern; work ethic; financial stability; and safe work environment.

The CIS Project Team also conducted a series of business requirements sessions with groups from across the Companies, which resulted in a comprehensive list of objective end-user requirements related to customer service and CIS systems. Bass & Company, with extensive

[5] The Chartwell Report on Customer Satisfaction, December 2002.

© Copyright 2008 Bass & Company. Unpublished work. All rights reserved.

experience in utility CIS systems, validated the requirements against the reasonable and necessary functions that can be expected to be supported by a CIS.

IV. Current System

The current CIS, ACCESS, has been in place at the Companies since 1991. While it has consistently performed many of the basic functions required at the time it was implemented, customer and user demands are exceeding the system's capabilities.

A. Automated Corporate Customer Energy Services System (ACCESS)

The Companies' current customer information system, ACCESS, was developed by Puget Sound Power and Light ("PSPL"), a Bellevue, Washington-based electric utility, in the 1980's. Hawaiian Electric purchased ACCESS in 1987 to automate many manual processes and implemented the system by 1991.[6] ACCESS was designed using technology originally dating back to the 1960's as a basic billing and meter data information system, and the system has been continually modified since 1991 to address gaps in the system, to reflect changing business requirements, and to further improve the system. The services that ACCESS provides includes, but is not limited to, establishing customer accounts, calculating and printing invoices (bills), tracking customer usage and payments, and notifying field services staff of service requests or collection work. ACCESS is the core system used to respond to customer requests. In fact, over 650 users in 19 departments across Hawaiian Electric rely on ACCESS for customer information and daily operations.

Annually, the Companies are responsible for approximately:

Function	*Current Approximate Annual Volume / Amount*
Bills Produced	3,000,000
Payment Processed	4,000,000
Customers Managed	400,000
Customer Calls	400,000
Credit Notices	200,000
Total Revenue	$1,200,000,000

B. Technical Specifications of ACCESS

The ACCESS system is made up of both hardware and software technologies – computer, databases and applications. This system is currently housed in Hawaiian Electric's computer center located in Honolulu with communication to and from the remote sites provided via a Transmission Control Protocol/Internet Protocol ("TCP/IP") interconnection.

The current technical platform includes:

[6] When the Companies purchased the system, PSPL supplied the system source code, but provided no support of the system. Thus, the Companies have had to provide all of the software support internally as there was no vendor support for the program.

V. Evaluation of ACCESS

The CIS project team performed an exhaustive evaluation of ACCESS to identify its strengths, weaknesses, limitations and constraints.

A. Overview

In order to evaluate ACCESS, it is important to document evaluation parameters. For CIS systems, these evaluation parameters are principally customer and user requirements.

The CIS Project Team identified the following fourteen (14) categories of requirements. Thirteen (13) of these categories related to functional use of the CIS and one (1) category related to the technology used by the CIS. These categories are:

1. Call Center and Customer Information – These requirements relate to the delivery of customer service. They include tracking and updating outage information and service requests, capturing and storing account information, consolidating information for customers with multiple accounts so that all accounts can be viewed at the same time, and scripting (providing structured answers to questions) to facilitate call handling.
2. Work Flow Management – The requirements in this section relate to tracking and managing any requests for follow-up work, creating and assigning tasks to individuals or groups, prioritizing and reprioritizing tasks, reassigning tasks, tracking progress and initiating follow-up.
3. Billing & Rates – These requirements support the complexities of billing and rates management. They include standard billing, billing of complex rate structures, consolidated billing, handling billing adjustments, cancel-rebill process, calculating average and budget bill amounts, line item accounting and the application of taxes. Also, included is the ability to assign individual rates to a

[7] International Business Machine ("IBM")
[8] CICS – Customer Information Control System

© Copyright 2003 Bass & Company. Unpublished work. All rights reserved.

particular customer, the ability to attach rates and rate riders to an account, perform rate comparisons, maintain and administer flat rates, and bill stepped time-of-use rate designs.

4. Payment Processing – These requirements address the posting of customer payments to customer accounts and the corporate books. They include an automated interface from the cash processing system, the ability to process multiple payment types, the tracking and management of payments, the management of returned checks, and the ability to support electronic processing and on-line payments.
5. Trouble & Engineering – These requirements address the need for the CIS to display the status of work and trouble orders. They include requirements for creating, viewing and tracking status of trouble tickets, creating and tracking requests for service at new locations and the ability to apply and track job costs based on the work request.
6. Credit – These requirements address protecting against revenue loss and customer delinquencies. They include the calculation and billing of deposits, guarantor agreements, collections treatment, the writing-off of inactive past due balances, estimating uncollectible reserve balances, and managing credit arrangements.
7. Metering – These requirements support the receipt and processing of metering information from the many meter types in use by Hawaiian Electric. They include acceptance and validation of standard meter data, interval meter data, KVAR, demand meters, and assignment and management of meter routes.
8. Field Service – These requirements focus on initiating and tracking work activities for the field services organization. They include initiating and managing collections field orders, high bill investigations, and prioritizing field orders for hand-held units.
9. Accounting – These requirements include interfacing to corporate General Ledger systems, performing bank reconciliations, calculating unbilled revenue and reporting daily and monthly activity.
10. Demand Side Management ("DSM") – These requirements relate to the management and tracking of DSM programs. They include associating customers and accounts to program applications, tracking application activity, managing and paying rebates, scheduling and tracking work, and tracking energy efficient equipment installations.
11. E-Business – These requirements support the extension of customer service functions to the Internet, including customer self-service, integrated electronic bill presentment and payment, and tracking customer activity.
12. Marketing – These requirements support the regulated services and support efforts of Energy Services Department ("ESD") in the large commercial customer

© Copyright 2003 Bass & Company. Unpublished work. All rights reserved.

segment. They include managing all customer contact information, tracking and managing trade ally information, and maintaining marketing rep information.

13. System Wide – These requirements relate to the functions, features, and technical items that apply to the entire CIS application and environment.
14. Technical Specifications – These requirements provide for the necessary technology specifications of the system (hardware, operating system, languages, database management system, etc.).

Within these 14 categories, the CIS Project Team identified six hundred and forty-five (645) individual functional requirements and seventy-eight (78) individual technical requirements relating to customer service and CIS. The list of all functional and technical requirements is attached as Attachment #2.

After analyzing these functional requirements in relation to ACCESS, the CIS Project Team found that while the 1980's design of ACCESS utilized then-current databases structures, programming environments, operating systems and system hardware, the passage of nearly 20 years since that time has rendered the ACCESS database structure, programming environments, operating systems and system hardware technologically obsolete as many major developments have taken place.[9]

B. Functional Deficiencies

While ACCESS and the related hardware and software still support the basic functional needs of the Companies, the CIS Project Team found that ACCESS is nonetheless outdated, is increasingly difficult and costly to maintain, and does not meet current and future business needs.

The CIS Project team found that ACCESS fails to provide the majority of basic functions available in today's customer information systems, including, service order tracking, contact history data, outage information gathering and dissemination, billing and pricing options (including bill format, duplicate bills, consolidated billing, complex billing, average and budget billing, time of use billing), energy user monitoring, payment options, ebusiness, extended hours, disconnect orders, returned checks, deposits, credit arrangements, non electric charges and revenue, reporting, as well as many other items.

Historically, the Companies have addressed these functional deficiencies by having employees manually perform all or part of certain tasks or by requesting modifications to the system through the Information Technology and Services ("ITS") Department and waiting for a programmer to design, develop and test the changes.

The CIS Project team compared ACCESS to these business requirements and found that the gap between required functionality and the functionality delivered by ACCESS is quite wide.

[9] Since the original installation of ACCESS, Hawaiian Electric's customer base has grown from 324,000 customers to over 417,000 customers. Not only have customer numbers increased, but customer demands and expectations have also increased as other industries and companies have incorporated technology to provide customers with more information, more services, more options, and more choices.

© Copyright 2008 Bass & Company. Unpublished work. All rights reserved.

The Team found that ACCESS currently only fully meets approximately 32% of the 645 required functions and partially meets approximately 14%.

ACCESS Functionality as a % of Functional Requirements

Requirements Category	Total Requirements	Base ACCESS Functionality *Fully Met*	*Partially Met*	*Not Met*
Call Center and Customer Information	55	7	20	28
Workflow Management	45	1	1	43
Billing & Rates	122	45	13	64
Payment Processing	64	31	8	25
Trouble & Engineering	26	18	6	2

Marketing	74	2	4	68
System Wide	25	2	1	22
Total Requirements	645	208	90	347
Percentage of Requirements Met		32.25%	13.95%	53.80%

Following is a description of how ACCESS fared in meeting Hawaiian Electric's critical business objectives in each of the following areas.

1. Call Center and Customer Information

Hawaiian Electric, as well as the utility industry as a whole, believes that customers are entitled to a level of service that provides them with:

- Accurate and timely information and answers;
- Timely responses to their requests; and
- Effective and ongoing outage communication.

However, because of the obsolescence and limitations of ACCESS it is becoming more difficult to deliver good service to Hawaiian Electric's customers in these areas.

For example, as noted previously, ACCESS cannot automatically track, monitor and report the creation and status of the hundreds of customer service requests received on a daily basis.

(a) Service Order Tracking

Over 30,000 annual Field Service orders are generated by ACCESS. These orders are either automatic when certain events occur or are manually requested by a Customer Service Representative ("CSR") using an online "Service" screen. These service orders are printed at a specified printer in the Field Services Division. After these orders print, no record of the

© Copyright 2003 Bass & Company. Unpublished work. All rights reserved.

orders exists in ACCESS as the system is unable to store this information into the database. This makes it difficult to answer the customer's question the first time because the CSR is not able to retrieve all the information from ACCESS that is necessary to respond to a customer's question. ACCESS also does not record or track who took the initial service request, who issued the service request, when it was sent to the Field Services office, who received it, who worked the assignment, when it was worked and when it was completed. Once the work orders are printed, the status of the work is unknown until the work is completed or unless someone in Field Services manually tracks and monitors the status of each request. In order to respond to a customers' inquiry on the status of a service request, the CSRs must call the Field Service office; and the staff must track down and research the status of such requests in many cases discussing the request with the 18 or so field representatives that would perform the work in question. It is clear that more people and more time are required to collect the necessary information to respond to a customer's inquiry about its service request. In order to provide "fast and friendly service," all customer requests and service orders, wherever initiated in the company, should be tracked and readily accessible by CSRs to determine the status.

In addition, Management must also have information in reports that enables them to manage the workload created by customer service requests, prioritize the work for service requests, shift or escalate priorities, and reassign or reschedule the work or staff. The necessity to record, monitor, report, and track all customer service requests goes beyond traditional customer service transactions (electric service starts and stops and transfer service requests). It also encompasses service orders for requests or work such as new meter installations, repair, and restoration of Hawaiian Electric facilities or equipment, meter tests, high-bill investigations, collections and recovery, customer complaints or non-customer account-related inquiries. Hawaiian Electric's current "system" (which includes email, post it notes, paper, manual tracking and monitoring of customer requests) does not meet its business needs or customer expectations.

(b) Customer Satisfaction

One element of customer satisfaction is consistency. Hawaiian Electric does its best to apply policies and procedures consistently, but ACCESS' limited functionality to record and monitor customer contacts, provide online scripts to CSRs, support help functions, or list and access reference material, increases the work and effort required to maintain consistency. Areas of particular concern are:

- Call handling consistency - providing consistent responses to all customers regardless of the agent or employee handling the matter.
- Contact management - a consistent and effective system to record and track all customer contacts.
- Problem resolution - the ability to respond to simple customer inquiries and document customer suggestions and complaints.

Copyright 2003 Bass & Company. Unpublished work. All rights reserved.

In addition to the above, customer satisfaction is also impacted by the ACCESS system's inability to record and maintain contact history, and automatically generate form letters. These limitations are discussed in more detail in the following sections.

(c) Contact History

An important aspect of handling customer service requests is managing and maintaining a thorough log of customer contacts with Hawaiian Electric. For example, when a customer calls Hawaiian Electric, ACCESS users type notes regarding their conversation to keep a record of customer requests, comments, and follow-up activity. When the user types these comments into ACCESS, there is a limitation of 180 characters or about three lines of text. In the screen examples from ACCESS below, you'll note that in order to track a particular conversation with an angry customer, the representative has to input the information into at least 7 different sections that are quite difficult to read and track.

If the comments exceed the limit, the user must start a new entry on a new section as noted in the example. However, when these comments are stored and displayed, they are displayed last entry first so the comments actually read backwards. Comments are not arranged by subject matter or category, so a user may have to read through many lines of information in order to understand what the customer is calling about or what action needs to be taken. This is not an easy task for the CSR to perform while the customer is talking to the CSR on the phone. It is even more difficult for others who may have to research or follow up on the matter at a later time.

One of the primary reasons why ACCESS is difficult to use for this function is that all of the information recorded in the "remarks" screens is not searchable or otherwise capable of being sorted by key words. The remarks screen and entry fields are used to capture all miscellaneous comments from the customers. For example, if the customer wanted some special handling for a bill, the comment from the customer would go into the remarks screen in free form text. Because the information is stored in free form text, ACCESS does not have the ability to sort or categorize, the text recorded. Furthermore, if Hawaiian Electric wanted to perform seemingly simple data extracts such as the number of customers who have called in over the years to request payment by credit card or to request extended office hours, or request certain types of additional information on their bill, it is not able to extract such data easily, efficiently or quickly. The problems that HECO personnel are confronted with are: Limited Data Fields and the lack of a structured database to store and index or categorize these comments. Using a simple database structure for these comments would allow easy retrieval of comments by category, such as credit card inquiries, hour of service inquiries or any category of information as assigned by the CSR taking the call.

(d) Customer Contact Information

ACCESS has a number of other basic business and customer service shortcomings. For example, ACCESS does not allow Hawaiian Electric to capture and store basic and frequently referred to customer contact information such as primary and secondary contact phone numbers; cell phone numbers, e-mail addresses; contact name and title; and customer-preferred contact method. This is understandable because 20 years ago when ACCESS was developed, programmers and utilities did not anticipate the need to store pager, email, fax, cell phone, and other information.

One of the biggest challenges of working with ACCESS is that over the years, Hawaiian Electric has created "work-arounds" that enable it to capture and retrieve critical customer data that ACCESS cannot manage. These work-arounds include separate databases that are "outside" of ACCESS. Examples of information stored outside of ACCESS include:

- Mailing information for customers, vendors, trade allies, consultants, and contractors;
- Historical information on all energy theft cases;
- Meter reading notes and instructions; and

© Copyright 2003 Bass & Company. Unpublished work. All rights reserved.

- Meter tests, power inspections, manual rereads, high bill inquires, and safety problems.

As a general rule, the creation of separate databases or systems is not recommended and should be avoided because:

- It results in additional maintenance of these separate data bases;
- The information is not integrated so users can easily miss the data contained in other systems;
- Additional time, work, and experience is required to access and utilize this database effectively; and
- Overall, it is less efficient, more costly, and more difficult to maintain separate databases.

(e) Information during Outages

When electric power is interrupted, HECO CSRs field the calls from the customers and enter the trouble call data into ACCESS. ACCESS creates a trouble order and prints this order (or trouble ticket) on a printer in the System Operation dispatch office. The printed trouble ticket is picked up by the Trouble Dispatchers, who review the printed trouble tickets to determine the location and respond by dispatching a trouble man to the location to find the cause of the outage reported.

Once the order is initiated in ACCESS and printed in the System Operation Department, all work or information related to the trouble ticket is dependent on the manual input and update of the outage information from other departments.

Like the service orders and requests, trouble tickets / trouble calls, are not tracked or monitored in ACCESS. CSRs do not know who received the trouble ticket, what time it was received or who the trouble ticket was assigned to unless System Operation calls, emails, faxes or otherwise inputs remarks or data on the Remarks or Trouble screen in ACCESS. In general, all information and updates on the outage, information on the cause of the outage, and restoration time updates are done manually and are obtained from the System Operation area.

Since the System Operation personnel work outages from the printed documents and track the outage response information in a separate database, this information is not automatically transferred to ACCESS. Therefore, ACCESS cannot be used to track the status of these trouble orders.

An outage management system that integrates the CIS, Energy Management System ("EMS"), Automatic Call Distribution ("ACD") / Interactive Voice Response ("IVR") and Geographic Information System ("GIS") will enable HECO to quickly track the status of trouble tickets and outage response and management. The integration of these systems will enable HECO to provide quicker updates to customers on the status and estimated restoration times of the outages.

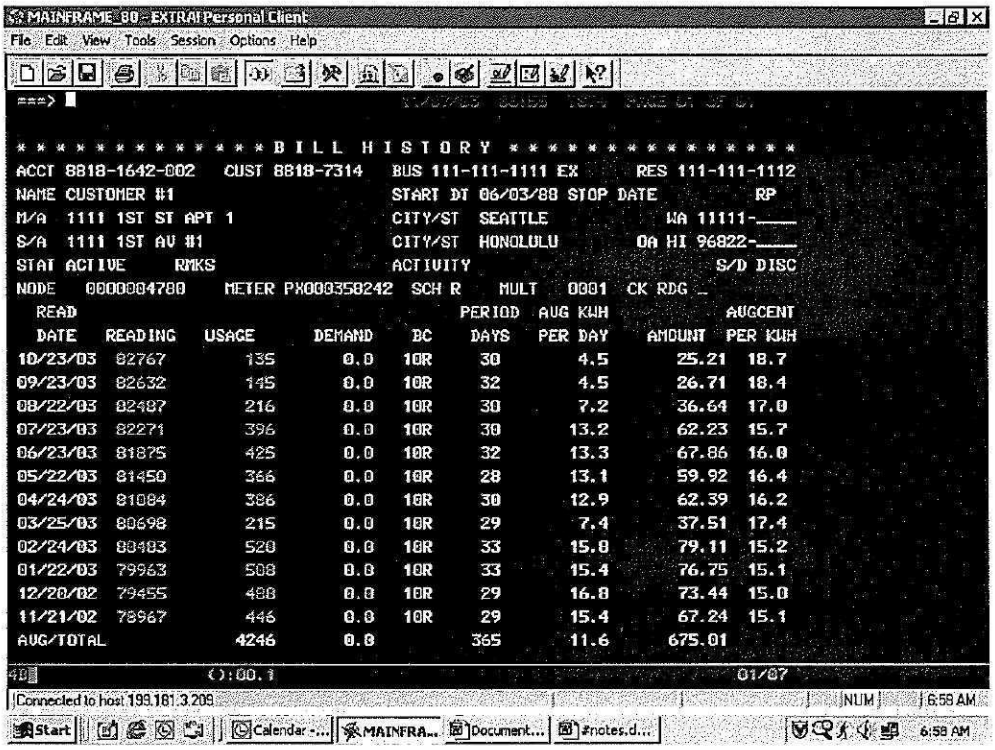
2. Billing & Pricing Options

The CIS Project team documented many business requirements related to billing and pricing options. While some of these requirements were necessary to provide new or enhanced services, many of the requirements are necessary to improve existing services. Some of the limitations related to the billing and pricing options are discussed below.

(a) Bill Format

The ACCESS system only supports one bill format regardless of the customer type, customer rate structure, service provided, or complexity. The basic design results in one page for each billable service and multiple pages for additional billable services.



Commercial customers have requested that bills include more details so that they can better understand and manage their energy use. For example, more detailed breakdown of line items for power factor, demand, and Energy Cost Adjustment Clause ("ECAC") will assist commercial customers who have many bill reviewers or who need handy descriptions. These additions will improve interpretation by accounting and finance departments for coincident /totalized billing and calculations of bill savings from electing different options (i.e. time-of-use pricing). More importantly, the changes will increase satisfaction and help to minimize the assistance required on common inquiries.

© Copyright 2003 Bass & Company. Unpublished work. All rights reserved.

In addition, the CSR's and Account Manager's "view" of a customer's bill in ACCESS is not the same as the actual bill that customers receive. Customers often have to fax a copy of their bill to the CSR or Account Manager or bring the bill to the Hawaiian Electric offices before someone can assist them. Providing the ability to view an exact copy of a customer's bill within the CIS would allow Hawaiian Electric to assist customers more quickly and efficiently.

(b) Duplicate Bills

Customers may request a copy of their current bill, but all requests for prior bills must be handled manually, resulting in delays to the customer and additional work for HECO's ITS staff.

The current system does not provide the ability to generate a copy of the customer's bill upon demand. However, if the customer requests a copy of his current bill, the CSR can initiate a transaction to print a copy of the bill during the nightly batch processing that will be available the next day. If the customer requests a prior bill, the request must be routed to the ITS support staff for manual processing.

(c) Consolidated Billing

Hawaiian Electric has several types of services or receivables that are typically billed to customers, in addition to basic electric services. However, ACCESS does not have the capability to bill customers for more than one type of service or receivable on a single page statement. Because of these limitations, Hawaiian Electric must send separate bills to customers for each service. Some examples that require separate bills include: deposits, electric and non-electric customer accounts receivable, charges for engineering work (line extensions), payments for damage, etc. Each year, Hawaiian Electric generates roughly 3,000 bills for "other" types of services (referred to as "OCARS bills"). Sending separate bills to customers on these separate line items often cause confusion or worse, frustration, because the customer after receiving one bill presumes that no additional bills will be sent. Our customers expect us to be efficient and include all items on a single bill. Consolidating OCARS and electric billing into a single statement, would improve customer service and avoid the cost of paper, printing, postage, and handling for a second bill.

(d) Complex Billing

Each month, Hawaiian Electric must manually calculate and bill approximately 150 very large commercial customers. The revenue from these large commercial customers is approximately $120 million per year, or about 10% of Hawaiian Electric's annual revenue. ACCESS is unable to automatically complete the bill calculation process due to the complexity of the calculations (these bills have multiple meters, coincident demand determinations, special billing arrangements, etc.). The Customer Accounting and Billing Section must use paper printouts and Excel spreadsheets to make these monthly calculations. On top of manually calculating these bills, the billing staff must then re-enter the manually calculated billing into ACCESS to generate a printed bill.

This current procedure is another example of the manual work that is required to provide Hawaiian Electric's largest customers with a timely and accurate complex commercial bill.

© Copyright 2003 Bass & Company. Unpublished Work. All rights reserved.

Manual work is both cumbersome, time consuming and has a greater likelihood of inadvertent calculation errors. Moreover, these errors are difficult to detect without additional time and scrutiny of each calculation. Once a billing error for these complex bills is detected, the correction process is equally time-consuming and arduous. Beyond the theoretically simple task of calculating commercial bills, CSRs and Account Managers are unable to readily access the information used for complex billing (i.e. meter data components). As a result, at times, it becomes difficult for Hawaiian Electric to assist its largest customers in a timely and efficient manner.

(e) Time-Of-Use ("TOU") Billing

TOU billing requires a rate structure that maintains energy and demand rates for multiple periods (on-peak, off-peak, and shoulder periods). TOU billing offers customers the opportunity to lower their electric bill by managing "when" they use electricity. They are charged a different price based upon the period it is consumed. Typically, electricity usage during "on-peak" periods is higher (and more expensive) than usage during "off-peak" hours.

On April 17, 2003, the Public Utilities Commission approved HECO's Transmittal No. 03-01 granting HECO approval to pilot a Residential Time–of-Use Service Program. Customers will be able to enroll in a program where their rates will fluctuate by the time of the day. Customers will have the ability to influence their monthly energy costs by shifting energy use to lower cost mid-peak and off-peak periods. In pursuing this residential TOU pilot, HECO is striving to offer residential customers new options for pricing and usage that have never been available before. Even with the limited number of customers approved for the pilot program (200 customers), it has been challenging to develop a system outside of ACCESS to collect the TOU data and calculate the bills for these customers on a monthly basis. If this program is later expanded on a full-scale basis to thousands of potential customers, ACCESS will require significant system modifications that will take more than a year to code because the modifications will have to be written in COBOL and the IMS hierarchical data base will have to be expanded. While the program modifications are being made, Customer Service personnel will have to perform the manual calculations to create the bills potentially requiring more resources so that these bills can be developed in a timely fashion.

(f) Energy User Monitoring

ESD personnel provide service to Hawaiian Electric's largest customers, many of which are billed $1 million or more each year. Part of the service provided to these large commercial customers includes regular reports that contain their electrical consumption for the previous 24 months. There are approximately 400 large commercial customers that are provided with such additional data. However, there are another 33,000 commercial customers who may call upon our ESD personnel for similar information.

While ACCESS provides a single report containing a graphical representation of the customer's 24-month energy usage, the report cannot be easily changed and does not provide the data in the graphical format requested by Hawaiian Electric's customers. As such, in order to provide more "customer friendly" information such as charts, graphs, trend

© Copyright 2003 Bass & Company. Unpublished work. All rights reserved.

analyses, Hawaiian Electric Account Managers must gather the electrical usage from ACCESS, manually create the graphs in Excel, and mail or e-mail them to the customers. Again, this is another example of manual work that is required to provide good customer service.

ESD provides additional services and information to Hawaiian Electric's largest commercial customers, such as rate analysis and bill monitoring. ESD will analyze commercial customer bills based on 12-month kW/kWh usage and recommend the best rate for the customer. This analysis is another manual work-around outside of the ACCESS system. ACCESS cannot perform this type of analysis, so Account Managers must manually research the usage, calculate and analyze customer use, and then create a comparison report usually using a program such as Excel.

While ACCESS can be modified to support some of the billing and pricing options discussed above, it cannot be modified to meet all of them without a complete re-write of the system.

(g) *Bill Calculation*

Just as ACCESS is unable to store additional customer data, it is also unable to retain additional "billing components". Billing components are all the elements incorporated into a customer's electric bill. The current rate structure is limited to the following billing components: customer charge, demand charge, energy charge, power factor, discount, and riders. The challenge is that Hawaiian Electric has additional billing components that must also be added to the rate structure, but cannot be added under the current system. When the billing of the kvar component of electricity changes from a power factor to a rate per kvar hour (kvarh) calculation, new billing components will be needed. This will require extensive modifications to both the rate structure and bill calculation module. In the meantime, Hawaiian Electric must also find another manual work-around to include all of the billing components to determine an accurate and correct bill.

3. Payment Options

Across the energy industry, utilities are implementing a variety of billing and payment options to better serve customers. Hawaiian Electric is no different. There are many types of services that not only meet or exceed customer expectations, but also provide a clear benefit to Hawaiian Electric's operations and business. For example, automatic bill payment (ABP) is an example of an option that is currently offered that has both customer and company benefits. Customers on ABP do not have to write a check, mail in a payment, or find parking and walk into Hawaiian Electric's offices – they save both time and postage. Similarly, the Companies will not have to physically handle payments and the Companies receive funds on the payment due date. Both Hawaiian Electric and Hawaiian Electric's ABP customers save time and money with ABP.

Customers want to have control over when the payments are due. Not only are elderly customers on a fixed income looking to select due dates but other customers who wish to manage their family's cash-flow are looking to match bill payments to payroll payment cycles. This has a two-fold benefit. First, the customers avoid late payment fees and

© Copyright 2007 Bass & Company. Unpublished work. All rights reserved.

collections notices while also improving their credit standing with the Companies. Second, Companies receive their payments on time and avoid the significant cost of collections.

Currently, ACCESS does not support flexible payment initiatives such as changing the due date or leveling the payment amount. In addition, it does not support other operational payment processing requirements such as processing multiple payment types, tracking, monitoring, and managing unapplied payments, and handling returned checks. Instead, Hawaiian Electric must perform time-consuming manual work.

4. Expanded Services

Many customers enjoy and expect Hawaiian Electric to provide a basic level of service, which includes walk-in or telephone response service. However, an increasing number of customers have grown accustomed to the convenience of being able to access accounts and request services 24 hours a day, seven days a week. Customers use automated voice menus and interactive voice response systems and have increased the use of email and other internet-based self-service options. Hawaiian Electric has implemented these options with significant limitations due to the constraints of ACCESS.

(a) eBusiness

As stated previously, customers can contact Hawaiian Electric via its website, www.heco.com. Customers can go to the above site and send requests to start, stop, transfer service, update account information, etc. Although it appears that the request is being handled automatically, in reality, the transaction screen is collecting the information and sending the request by e-mail to the Customer Service Department where a CSR enters the data for the request into ACCESS. In addition, all other customer e-mails received via the website are logged and manually distributed to the functional areas that need to respond.

Because of the limitations and manual nature of the work, the Companies have not extensively advertised or promoted these Internet capabilities as a significant increase in Internet customer service volume could potentially decrease service levels in the customer service center and reduce customer satisfaction. Even without promoting these capabilities, Hawaiian Electric has seen a significant increase in the volume of customer transactions via the web site. Customer contacts and transactions received via the Internet are doubling year over year.

(b) Extended Hours

Most customers work during Hawaiian Electric's normal business hours. Because of this, many customers have expressed a desire for extended operating hours.

One constraint to extending the operating hours is its impact on the after hours batch processing time required for ACCESS. In a "batch" process, mail-in payments, meter reads and other customer transactions are updated in the system beginning at 7:00 p.m. every evening. This process runs, on average, until approximately 2:00 a.m. every morning. During this time, no additional information can be input into ACCESS and the system is available in "read-only" mode. Although batch processing is generally completed by 2:00 a.m., there have been a number of times when batch processing is delayed beyond this time.

© Copyright 2008 Bass & Company. Unpublished work. All rights reserved.

In addition, at the end of each month, the batch window extends to nearly 7:00 a.m. to produce accounting reports for month-end revenue.

Before Hawaiian Electric can consider expanding its operating hours, it must first address batch processing requirements or develop another manual work process for information inputting after 7:00 p.m. For example, payments or other customer transactions that are received after batch processing starts will need to be held until the system can be updated during the next batch run the following evening. This creates additional work and delays the update of customer records until the next business day.

In addition to providing access to ACCESS for many of the self-service initiatives and requirements, ACCESS needs the capability to support online transactions 24 hours per day, 7 days a week.

5. Other Requirements

There are a number of business requirements that are essential to managing Hawaiian Electric staff, resources and costs. The requirements are in the area of credit and collections and management reporting.

Credit controls are an important CIS function necessary to ensuring effective management of delinquent accounts and reducing the risk of non-payment, default, and bad-debt write-offs. Hawaiian Electric's credit policies provide customers ample time to pay for the electric service that they have already consumed. While the vast majority of Hawaiian Electric's customers pay in a timely manner, there are a fair percentage of customers who do not pay their bill by the due date resulting in collections activity and, ultimately, field activity to collect the past due balances or disconnect the customer. For customers who pay beyond terms, and in fairness to all stakeholders, including ratepayers, it is critical to have a system that seeks to minimize collections cost while maximizing recovery of outstanding amounts owed to the Companies.

In order to more effectively manage delinquent accounts Hawaiian Electric needs to:

- Calculate, bill, and collect security deposits based on expected usage, predicted customer risk and expected default rates.
- Identify, track and manage fraud.
- Prevent, track and monitor insufficient funds (returned) checks.
- Further automate notices and calls to manage account delinquency and default risk.
- Further automate activity and credit action that reinforces timely payment behavior and minimizes or eliminates untimely (delinquent) payment behavior.

Although basic credit functionality exists in ACCESS today, much of the processes are handled manually.

© Copyright 2008 Bass & Company. Unpublished work. All rights reserved.

(a) Disconnect Orders

The ultimate tool for a utility to manage delinquency is disconnection of service. A customer's sense of urgency to pay an outstanding past due balance is greatly increased when the lights go out. As with service order tracking, ACCESS does not have the ability to track and manage disconnection orders through closure. Unlike service requests and trouble tickets, all disconnection orders are created during the nightly batch process, printed on the Computer Center's printer, and delivered to Field Services each morning. Once the orders are printed, ACCESS cannot track the status of the orders or ensure completion of the order without manually checking the status on a daily basis.

Disconnect orders are not the only work performed by Field Services. Meter sets, meter tests, manual meter re-reads and high-bill investigations all compete for the limited resources of Field Services. Work that cannot be performed on a given day can only be tracked manually as ACCESS cannot prioritize or track outstanding work requests.

(b) Returned Checks

ACCESS is unable to track and manage the financial transactions created by returned checks. This is a significant problem as the receipt of a returned check creates transactions that mask the true age of a delinquent account balances.

For example, if a customer has a balance due with a due date of June 1st and pays with an insufficient funds check, the account is credited the payment until the bad check is discovered. Once the check is deemed insufficient, the payment is reversed but the charge is created on the date the payment was reversed, thus granting the customer a grace period.

Payment Due Date:	June 1, 2003
Payment by Check Received:	June 1, 2003
Check Returned:	June 15, 2003

In the above example, the customer's check was returned for insufficient funds on June 15, 2003. ACCESS must reverse the payment and re-debit the account.

Re-debit Account:	June 15, 2003

However, in doing so, the system characterizes the re-debit as a new charge incurred as of June 15, 2003, the date of the re-debit. This inaccurately reflects the actual age of the receivable, because the failure to pay should be reflected as of June 1, 2003. ACCESS is unable to discern that a bounced check created the debit and cannot "continue" the collections process from the June 1, 2003, date. Instead, the system characterizes the bounced check as an activity occurring on June 15, 2003, and customers who pay with a bad check are unintentionally afforded an unwarranted grace period. Since collections activity is tied to the age of the outstanding balance, customers may avoid collection and termination of service.

(c) Security Deposits

Hawaiian Electric is allowed under tariff to request security deposits from customers that have not demonstrated credit-worthiness. The current process relies on looking up past

© Copyright 2003 Bass & Company. Unpublished work. All rights reserved.

billing history information in ACCESS to determine deposit levels. Deposits are required from customers without sufficient credit history or have demonstrated poor payment performance in the past[10]. However, ACCESS only has information on customers who have had service with Hawaiian Electric in the past, and only with specific customers named on the account. Customers identified in ACCESS who have had disconnect notices on a previous account are asked to pay security deposits. For new customers who have not had service with Hawaiian Electric or are using a different name to apply for service, these customers are required to pay a deposit based on current business rules as allowed by the tariff.

Hawaiian Electric realizes that the current process is inconvenient to customers who have demonstrated good credit with other service providers and have good credit history with accredited credit bureaus. ACCESS is not able to automatically query an external credit bureau to determine a customer's credit risk. The ability to establish credit through prior non-electric credit history or through accredited credit bureaus is another example of a win-win for both customers and Hawaiian Electric. The benefits are three-fold. First, new customers to Hawaii with a good credit rating would not be burdened with a deposit request. Second, Hawaiian Electric would not have to pay accrued interest charges on deposits held unnecessarily. Third, access to credit bureaus through a direct interface with the CIS, combined with the ability to accurately reflect credit risk based on a customer's payment behaviors would allow Hawaiian Electric to more efficiently and effectively manage and possibly prevent customer delinquencies and fraud.

(d) Credit Arrangements

Credit arrangements are allowed for customers who are unable to pay their bill and need additional time. While Hawaiian Electric provides customers with reasonable options to avoid termination of service, the Companies also require an effective credit system with sufficient controls in place to limit abuses. Currently, ACCESS does not limit the number of credit arrangements a customer may have. In some cases, customers have requested several consecutive credit arrangements dragging out repayment of past due bills over several months.

Hawaiian Electric needs to have the basic ability to tie payment options and payment arrangement eligibility to a customer's risk and credit profile to minimize delinquency and default and it needs an automated system that can provide the ability to manage credit arrangements based on customer risk as indicated by the customer's past payment performance and the amounts outstanding.

(e) Non-Electric Charges and Revenue

Since 1990, Hawaiian Electric has been billing customers for non-electric charges such as line extensions, pole attachments, and damage claims. These bills and receivables must be mailed and tracked separately from a customer's regular electricity bill. Although ACCESS

[10] Deposits are assessed based on the credit worthiness of customers as described in Hawaiian Electric's Tariffs Applicable to Electric Service.

© Copyright 2008 Bass & Company. Unpublished work. All rights reserved.

has the ability to bill for these non-commodity charges, it has shortcomings. ACCESS is used to generate the initial bill and follows-up with a payment reminder notice 30 days later. But if the initial invoice and reminder notice are ignored, the system does not perform any follow-up activity to recover payment. Since follow-up is performed manually, many of these accounts are not acted upon in a timely a manner. In addition, when recognizing that a bill will not be paid, transferring the account from active and outstanding to write-off is manual. A supervisor must review the accounts each month to determine if an account is still in good standing or if it should be written off.

Since some of these charges are not typical cycle billing charges like electric service, Hawaiian Electric needs to be able to automatically bill for non-electric charges and integrate collection management processes with the timing of payment terms and conditions. The CIS system should also automate write-offs or trigger review of write-offs based on pre-set criteria.

Hawaiian Electric and all customers (who are bearing the cost of managing its delinquent accounts) will benefit from a system that is able to store, track and report the data needed to manage collections and recovery. ACCESS is unable to support these requirements because it cannot adequately:

- Create and manage calling lists for collections purposes
- Create aging reports on accounts
- Track and manage a collections campaign

(f) Reporting

ACCESS users must deal with the lack of system-generated reports, the inability to create ad-hoc reports, and inability to produce simple user queries. This is an inherent limitation of the system's hierarchal database structure. Since the Information Management System ("IMS") database is used primarily in transaction processing environments, it is not designed for operational reporting. Retrieving information from the system is difficult and time-consuming and typically requires a skilled information technology programmer to write an application to create a report for the information requested. Work requests for reports are prioritized and put in a work queue and there is currently a backlog for report requests. The backlog is the result of a lack of resources to write the report applications and the cumbersome nature of the database. Therefore, much of the information that is needed to run the business – daily operating reports – is generated manually with a system outside ACCESS or delayed and, therefore, untimely.

In order to obtain the level of reporting required to continue to effectively manage the business, Hawaiian Electric must replace the current hierarchal IMS database with a "relational" database. Relational databases are much more flexible allowing various types of information to be tied together through multiple account, premise and customer relationships. While the replacement of the ACCESS system's IMS database was considered, the risk of jeopardizing the core billing functionality made this option undesirable.

C. Technical Deficiencies

In addition to the functional deficiencies, one of the more significant deficiencies found by the team is ACCESS' aged technology. As discussed in more detail below, the CIS Project Team noted many of the technological limitations of ACCESS including: 1) that the IMS hierarchical database has been surpassed by relational databases, 2) the COBOL and programming languages are becoming outdated, 3) the antiquated "green screen" user interface is challenging, 4) system interfaces are cumbersome and time consuming to develop and implement, and 5) the program structure lacks many common controls found in modern CIS. Hawaiian Electric, despite its own internal capabilities, cannot confidently handle fundamental issues of this complexity.

1. IMS Database vs. Relational Database

IMS is a hierarchical database management system. First released in the 1960's in support of NASA's Apollo space missions, the eighth version of the software was released in November of 2002. IMS is used to optimize storage and retrieval of operational data like that used in billing systems, package tracking systems or inventory management systems. IMS stores basic transaction-based information that is being constantly updated, such as invoice amounts or payments received. This information is specific to the system generating it and changes over time, typically month-to-month. According to IBM, IMS requires longer development times due to its highly structured environment and it is more difficult to create reports in it than in relational databases.[11] The highly structured environment requires the programmers to know the exact attributes of the data and precisely where it is stored. IMS has been improved several times in the last 40 years and is targeted by IBM to companies requiring simple, high-volume transaction processing environments.

Relational databases offer a different way to store and retrieve data. By providing independence from the data structure, relational databases allow companies to store and retrieve information across multiple databases for decision-making purposes. Development time is much shorter for relational databases since the information stored does not have to be logically sequenced to support operational reporting.

For applications that undergo constant change or require significant reporting, IMS is at a significant disadvantage to relational database technologies. IMS is inflexible and difficult to modify, making it difficult to add, delete or change information fields to support the Companies' increasingly demanding customer and business needs. Relational database structures, on the other hand, allow almost unlimited modifications, relational queries, and cross utilization among different programs with comparative ease. Relational database technologies offer greater flexibility, produce better management reports and have far shorter development timelines than IMS.

For example, Hawaiian Electric has reached the point where additional data cannot be added to existing database segments. There is no space available in the customer and location root

[11] IBM Corporation. IMS product information.

© Copyright 2003 Bass & Company. Unpublished work. All rights reserved.

segments and only 67 bytes of filler available in the account root segment. At this time, even minor enhancements cannot be performed in ACCESS due to the lack of available space in the database segments to store new data. While the IMS database can be expanded by increasing the size of the data segments, all of the programs that access the additional data would be required to be recompiled. Thus, expanding segment sizes are manually intensive processes as database reorganizations are required for each expansion.[12] For example, the customer database root segment has no room to add additional data fields. It has been estimated that it will take 1300 hours to increase the size of the segment to allow for the addition of new data fields. Even with this expansion, there are still fundamental problems such as ACCESS will still be unable to allow users to make queries to extract data and generate reports, as they are needed. Each time a new extract or report is needed, a work request is sent to HECO's Information and Technology Service Department and the ACCESS support staff has to write a mini program to obtain the requested report or extract. Modifications to ACCESS are simply not able to correct the fundamental limitations of the current database structure. Moreover, the lack of available training on IMS and mainframe development environments has made it difficult to find experienced and skilled IMS database programmers and analysts to work with these technologies.

Another significant technological deficiency is the use of COBOL as the underlying program language for ACCESS. Although COBOL was once the premier programming language for mainframe applications, newer systems are almost exclusively designed in graphical client-server environments using C++, Visual C++, PowerBuilder and web-based JAVA.

> *COBOL remains one of the most widely used languages; but as COBOL developers retire, enterprises face the risk of losing specialists capable of maintaining COBOL legacies. Therefore, enterprises must develop a long-term strategy to migrate their COBOL legacies to new technologies.*
>
> *-Application Development Skill and Technology Trends*
> *Gartner Group, September 18, 2002*

[12] A "segment" is a unit of access; for the database system, the smallest amount of data that can be transferred by one operation. IMS/ESA V4 Glossary via IBM Book Manager Book Server. Similar to a row in a spreadsheet, a record in a sequential file, and a row in a relational database. When a read of a sequential file is done, a record is returned; when a get is performed against an IMS database, a segment is returned.
Segment sizes:

Customer Root Segment – 270 bytes
Account Root Segment – 300 bytes
Location Root Segment – 165 bytes
Note: 1 byte is comparable to 1 character

Database segments are initially sized to hold all known data fields with additional space allocated, but not used, for any new fields that are needed in the future. For example, a database segment of 300 bytes may have 100 bytes allocated for future use. Adding new fields is relative easy when unused space is available in the segment to hold the new fields. However, when the allocated space is used up, fields can't be added until the size of the segment is increased. Increasing the size of a segment requires specialized work by the database administration team and application work by the support staff. First the definition of the database segment must be changed to reflect the new size (from 300 to 400 bytes), and all the 300-byte segments must be physically changed to occupy 400 bytes of storage. This process requires that all 300-byte segments be removed and inserted back in as 400-byte segments. From an application perspective, all programs that are expecting a 300-byte record need to be modified to reflect a 400-byte record.

With the advent of new computer operating systems, network and computing technologies and new software applications, IT professionals currently in the field and entering the field need to be trained to operate and support these continued technological advances. Both higher education and corporate training in computer programming, Information Technology and Computer Networking now focus on meeting the ongoing need to maintain and operate these new and complex systems. In light of college and corporate focus on training IT professionals on current or new systems and applications, the number of professionals trained, experienced, and qualified to work on older systems steadily declines year after year. There is simply less and less market demand for skills in aging technology. The challenge facing Hawaiian Electric is aptly described as follows:

According to a 1997 report by Gartner Group, a leading technology research organization, nearly 80% of the computer programming in use at that time was written in COBOL, the programming language used by ACCESS.

However, of the new systems being developed and implemented by 1999, only 50% were being written in COBOL. Looking out to 2005, it was estimated that only 15% of the new systems delivered would be written in COBOL.[13] As the number of systems being developed in the COBOL programming language declines, the number of IT professionals trained or proficient in COBOL will also decline.

> *Ten years of limited or no investment in legacy systems and legacy programmers have left IS (Information Systems) organizations wondering who will take care of all these systems that refuse to die. Many organizations tell Gartner that their concern about skills is driving fundamental transformations from, for example, mainframe to Unix.*
>
> *-The Skills Drain: When Programs Outlive the Programmers*
> *Gartner Group, April 29, 2002*

Training for programmers emphasizes databases, operating systems, and programming languages in demand today. The following colleges and universities were contacted and none offer or plan to offer classes on COBOL.[14]

- University of Hawaii
- Hawaii Pacific University
- Chaminade University of Honolulu
- Kapiolani Community College
- Honolulu Community College

[13] History of COBOL, Jiehong Li, 2002

[14] The Admissions Office of each institution were called on May 13, 2003 and asked if they currently offered or were planning to offer classes in COBOL programming.

- Heald College
- University of Phoenix

ACCESS has performed reasonably well supporting the basic functions of a CIS with quick response time and character-based codes, but its long-term viability is doubtful given its age and the small pool of skilled resources available to sustain effective operation. Not only has the user interface become obsolete in the era of the Internet, Windows, and mouse navigation, but also the difficulty of finding qualified technical staff steadily increases the risk of system failure. Any modifications to ACCESS raise the risk that coding errors may be introduced into the 1,000,000-plus lines of code that make up ACCESS. Without experienced technical staff, fixing inadvertent coding errors have been lengthy and costly processes which impact Hawaiian Electric's ability to effectively trouble shoot problems and provide customer service, produce bills or process payments for its 400,000 customers each month.

In the 12 years since its installation, Hawaiian Electric has made ongoing code changes and modifications to the system. These ongoing modifications require anywhere from a day to several months of programming and testing time to develop, program and implement. Ongoing modifications to ACCESS were required to further tailor ACCESS to meet Hawaiian Electric's business and customer needs, functionality and maintain system stability. This has resulted in an extremely complex, proprietary system that requires both great knowledge and great care in complex modifications and further upgrading.

However, while COBOL is an antiquated programming environment, it is not feasible to just replace COBOL as the underlying program language for ACCESS without a complete revision to the application code and the underlying database. Replacing the programming environment with a more modern, flexible programming environment is like trying to put a jet engine in a bi-plane. The time and cost to get the components to work together would exceed the time and cost of buying a new CIS.

2. Graphical User Interface (GUI)

The CIS Project Team also noted the archaic screen design of the ACCESS system – multi-colored text on a black background, 4-character transaction codes to navigate to different screens, page upon page of screens containing information that need to be pieced together to respond appropriately to customer requests – makes the system difficult to use and navigate. At a time when all systems are point-and-click, windows and mouse-based, training time on ACCESS' out-dated screens is lengthy and takes several months to a year or more for a CSR to learn and use the system effectively.

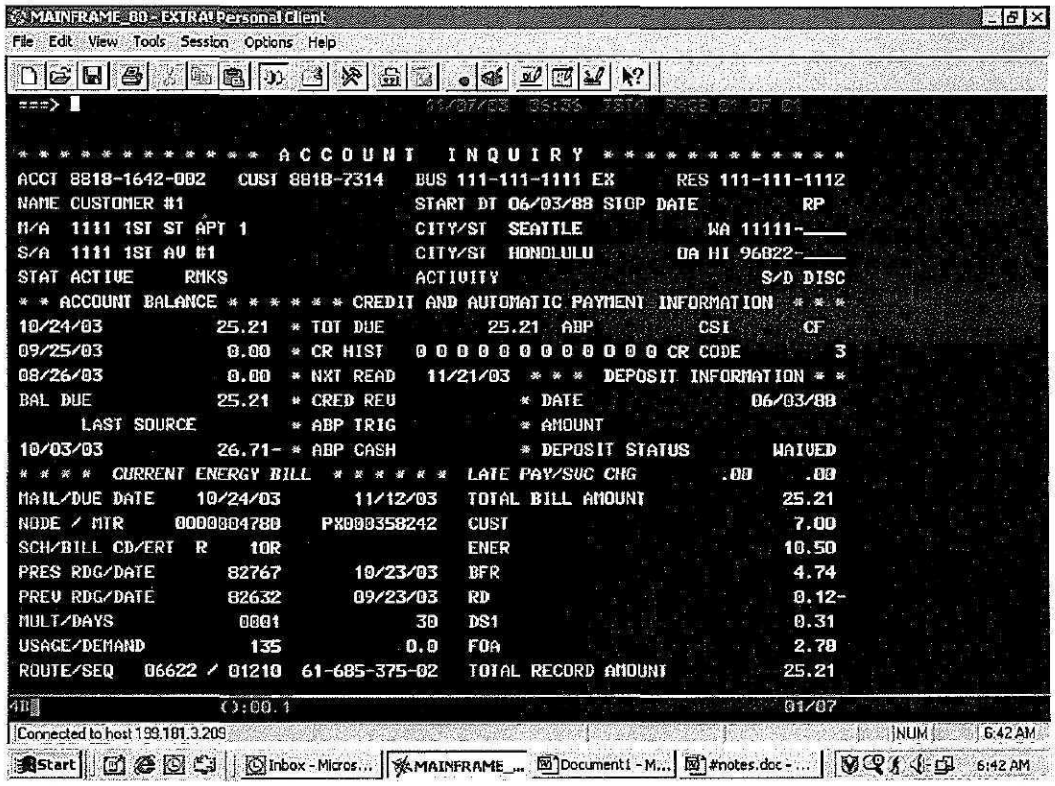
Without easy navigation, inexperienced users cannot "work their way" through the system. Users must know the 4-character transaction code of the screen that they want in order to get to that screen.

A far greater number of "screens" are necessary in a mainframe character-based system, because only a set number of display elements can be shown on the screen at a time.

© Copyright 2008 Bass & Company. Unpublished work. All rights reserved.

Bass & Company
Management Consultants, LLC

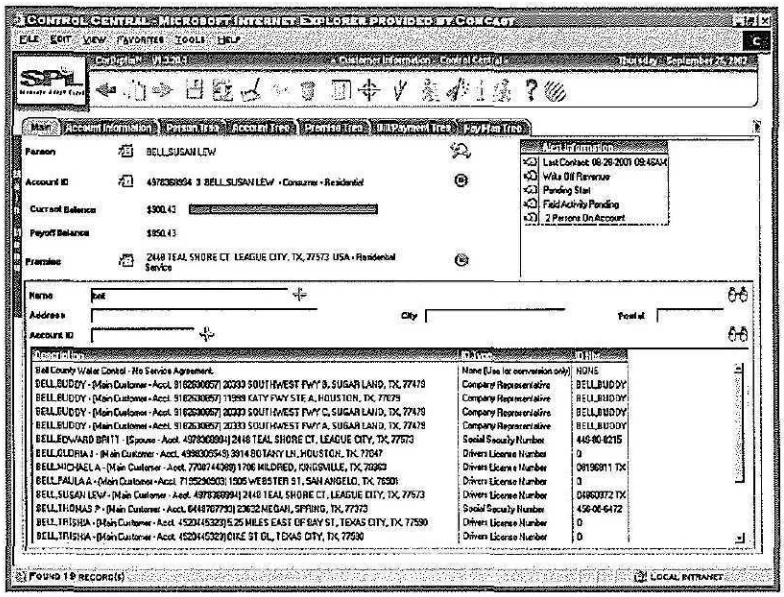
Therefore, when space is not available for more data to be displayed the user has to page to the next screen.



The CIS Project Team compared the ACCESS display to the modern full graphics display, where there is less of a constraint on the amount of information that can be displayed. As a result, the information can be structured so that all corresponding pieces of data can be displayed in a window for the user to browse through using the scroll bars rather than paging from screen to screen to see all of the data.

© Copyright 2003 Bass & Company. Unpublished work. All rights reserved.

Graphical User Interface Example



This ease of displaying of information allows new, inexperienced, users to "work their way" around the systems – a more intuitive operation – thereby shortening training time. Moreover, over the past five years, the proliferation of Microsoft Office and Windows has created a workforce familiar with the graphical user interface. Virtually all of Hawaiian Electric's employees who would be using the new CIS have some or experience in systems or applications with graphical user interfaces. All new systems rely heavily on graphical user interfaces and they are considered a standard element and integral part of any new system.

3. <u>System Interfaces</u>

ACCESS currently interfaces to several systems to transfer operational data between systems. Automated interfaces have been built to send summarized information to the General Ledger, Accounts Payable, Accounts Receivable, MIMS Work Order, Trouble and Web applications. However, these interfaces must be custom built for each application. These interfaces can be a batch interface or an online interface.

With new systems and applications being planned for the near future, new system interfaces will need to be developed between the new systems and CIS. One example is the proposed Outage Management System. When this system is installed, an interface to the CIS will need to be developed. The Companies need to be cognizant of the possibility that as modification or programming changes in ACCESS are made, the interfaces to each of these systems may potentially be impacted and could lead to more programming costs for their respective interfaces. With a new CIS based on new programming languages and relational database, this process is less cumbersome and time-consuming than it would be with ACCESS.

© Copyright 2003 Bass & Company. Unpublished work. All rights reserved.

4. Program Structure

Due to the current limited functionality of the system, ACCESS lacks many common system controls. ACCESS cannot detect or prevent simultaneous updates of customer information. If two or more users work on the same customer account within ACCESS at the same time, both users are allowed to update the information. Simultaneous updates have occurred and continue to occur resulting in one piece of information over-riding the other. Rate riders are currently used to calculate various charges and discounts for our larger customers. Because of system design and database limitations, ACCESS can only support a maximum of ten rider schedules per billable rate schedule. When another rate rider is needed, a previous rider must be deleted from the system. This causes problems when billing adjustments occur. If an adjustment is required for a period when the deleted rate rider was in effect, the system has no history of that previous rider requiring extensive research and manual billing by Hawaiian Electric's Billing Analysts.

D. ACCESS Evaluation Conclusion

After a comprehensive review of ACCESS, the CIS Project Team concluded that ACCESS is outdated and is limited in its ability to meet the current and future needs of Hawaiian Electric and its customers. Some of the more notable deficiencies included the following:

- Ineffective application of technology. Trouble calls, service orders, and self-service orders are handled manually, leading to the inevitable gaps in workflow, communication, handoffs, work monitoring and ultimately, customer service impacts. While ACCESS is a computer-based system, it contains no functionality to automate and streamline this work (workflow, service order tracking). The Companies need to have a system that can provide this critical and basic tool in order to track and manage work and deliver effective customer service.
- Limited system information and impact on customer service capability. CSRs cannot respond in a timely manner to address customers' concerns when there is an outage and are not able to adequately answer questions related to customer service requests. The underlying problem has been and will continue to be the difficulty in getting comprehensive information from ACCESS. It is very difficult for CSRs to navigate in ACCESS as they often need to view several different screens of data to get the information they need. Also input from other areas, on the status of an outage or service request is minimal or non-existent so the CSR's in many cases are forced to find alternative means of getting the information such as calling or e-mailing personnel in other departments.
- Inability to address customer concerns. High bill inquires are among the most common customer calls. The current system does not allow

© Copyright 2007 Bass & Company. Unpublished work. All rights reserved.

CSRs to see an exact duplicate of the customer's bill, complicating what is often a routine call. The reason for this is that the actual invoice or bill is not actually stored in ACCESS. As a result, when the customer asks for an explanation of what is on the bill the CSR does not have the capability to "see" the data in the same way as the customer.

- Increasing internal system workarounds. The limitations of the ACCESS system cause employees to find alternative manual methods to store, retrieve and report information, or solve problems. These methods have been developed over time because, 1) ACCESS could not provide the functionality and 2) things had to be done so that the employees in the Customer Service area would be able to respond to customers' requests and questions. This includes basic "core" functionality required of any CIS, namely, producing accurate and timely customer invoices.
- System database limitations. The ACCESS databases do not have space to add needed new fields. New data fields are needed in ACCESS to accommodate changes that are necessary when implementing new functions or to just provide more flexibility in the system. One example is that currently in ACCESS only two phone numbers are stored, usually a home phone number and one work number. Some customers prefer to be contacted by alternative means, for example cell phones. Having the ability to input all the phone numbers including cell phone numbers into the database will make it easier for HECO to identify who is calling and will provide HECO with more ways to contact the customer.
- Technological obsolescence. There are a number of technological issues related to continued use of ACCESS. One is that the ACCESS programming language, COBOL, is an older language not used extensively in applications developed on current development platforms, and as a result, is difficult to support. Second, the IMS hierarchical database (Information Management Services or IMS database) limits the ability to retain relevant customer information. Third, ACCESS does not adequately allow for the Internet's emergence as a business and consumer tool. Use of the Internet provides customers with the technology for self-service and to gather the information needed to make informed energy management decisions.

© Copyright 2008 Bass & Company. Unpublished work. All rights reserved.

- Reliance on a few skilled employees. Hawaiian Electric has a small ACCESS support team that resolves production problems and implements system enhancements. This small group of programmers and analysts must support a system with over 1,000,000 lines of code. With this limited workforce available to perform the modifications in ACCESS, Hawaiian Electric is severely limited in what it is able to do to meet changing consumer demands. The combined effect of a small programming group and the limited knowledge that new or inexperienced programmers have of COBOL and the IMS database adds to the length of time required to develop new functions or capabilities in ACCESS. Moreover, hundreds of different programs that make up ACCESS and the database are so tightly integrated that modifications in one area may trigger unintended consequences elsewhere in the system. Finally, the loss of any of the Companies' essential employees could be detrimental to the utility as it is becoming difficult to find people with the necessary knowledge and education (COBOL, IMS database, etc.) who are willing to work on systems like ACCESS.
- Industry and regulatory change. Technological advances and deregulation changed the industry in the 1990s. Utilities were faced with the reality that their existing customer information systems had not been designed to provide functions required in a changing electricity market. This is not surprising, since even the market had not yet anticipated and therefore defined its new business needs.[15] For example, the utility's ability to readily track customer data to achieve new marketing objectives, or bill, offer, and manage new value-added products and services were all critical to competing in a changing electricity market. These basic capabilities were generally missing from most legacy CIS systems. New rate structures, new programs and services, and evolving regulation require new capabilities in the CIS.
- Changing business needs and customer expectations. Customers have come to expect service from Hawaiian Electric that is comparable to that of other businesses. There are a number of expectations that the Companies are unable to fulfill due to the functional and technical limitations of ACCESS.

[15] PG&E Chapter 4, Reasonableness of CIS Costs, pages 4-10, 4-11; Guerry Water, Vice President, SPL Worldgroup testimony.

© Copyright 2008 Bass & Company. Unpublished work. All rights reserved.

- Strategic business initiatives. HECO's strategic initiatives, including the new Outage Management System, will need to interface with the CIS.
- Emergence of fully functional pre-packaged CIS systems. In recent years, CIS systems have become more than basic billing and payments systems. In response to the functional and technological obsolescence issues of using ACCESS and the ever-shrinking labor pools of experienced programmers, CIS vendors in the US and Europe developed feature-rich, flexible systems using modern programming languages, that addressed these changing needs as well as provided the basic utility billing, payment, and customer account features of legacy systems. These new systems were further enhanced to offer more sophisticated industry service offerings in billing, pricing, and metering. They also enable integration to enterprise work management systems. Current CIS systems are capable of handling complex billing processes, special rate structures (e.g., Time-Of-Use Rates) and new business processes, as well as interface more efficiently with other new systems (e.g., an Outage Management System or OMS).

Currently, Bass & Company and the CIS Project team have found that ACCESS does not support the required level of service for either its internal or external users. Simply stated, ACCESS is outdated and is limited in its ability to meet the current and future needs of Hawaiian Electric and its customers. ACCESS does not fully support the utility functions of outage reporting and response, complex billing, credit, collections and management reporting.[16] A new CIS will easily surpass the capabilities of ACCESS and will have significantly more features that will enable the Companies to (1) further automate current manual processes, (2) record, store, manage and access far more customer data effectively, and (3) "easily" integrate with other new systems, such as the Outage Management System (for HECO). As the Companies expand their service offerings further, a new CIS will advance these initiatives such as time-of-use metering as the new CIS will be able to automatically calculate the billing for different pricing and rates.[17]

VI. Alternatives Considered

Based on the number of shortcomings inherent in ACCESS due to its lack of functionality as well as its old and inflexible software, the CIS Project Team determined that substantial

[16] The Companies are not alone in finding deficiencies in ACCESS. The system's original developer, PSPL, replaced ACCESS in 2000 due to the system's inflexibility and inability to continue to meet the needs of the utility.

[17] For example, a new CIS will have expanded customer data base and contact management capabilities, configurable billing and payment capabilities, customer segmentation, contract management, web-integration, interactive voice request capabilities, real-time customer request tracking, multiple rate structures, time-of-use billing, interval meter data capabilities – none of which is currently available on ACCESS.

© Copyright 2003 Bass & Company. Unpublished work. All rights reserved.

modifications and upgrades are necessary to fully meet both customer and business requirements now and in the future.[18] Without a more functional, flexible, and easily adaptable CIS, Hawaiian Electric will increasingly struggle to meet customer needs. With this realization, the CIS Project team evaluated the following alternatives and options:

1) Replace ACCESS by outsourcing the CIS to an external vendor

2) Custom-build a new CIS in-house

3) Modify ACCESS to meet the current needs

4) Replace ACCESS with a commercially available pre-packaged CIS system

A. Alternative 1 – Outsourcing of the Customer Information Functions

The CIS Project Team considered outsourcing the customer information functions as one of the options for meeting current critical deficiencies and business requirements. Outsourcing is an attractive option that provides a means to replace old systems without going through the complex and challenging process of acquiring and implementing a new system in-house.

However, outsourcing arrangements also have their downsides. For example, Hawaiian Electric must rely on the vendor's responsiveness and level of service to meet its business requirements in a timely manner. Also, requests for changes that were not originally in the contract can be expensive. Another critical issue is the vendor's longevity in the business. Vendor default on a long-term contract with Hawaiian Electric could prove to be extremely costly.

As part of a Request for Quote (RFQ) submitted to vendors, the CIS Project Team asked vendors to submit a proposed option to lease a system installed and operated by the vendor. Three vendors responded with outsourcing options.

Cost	Vendor #1	Vendor #2	Vendor #3
Total Cost - 14 years	$53,785,000	$88,159,000	$48,405,000

Based on detailed cost information provided by the vendors, the total cost to select, install and operate an outsourced solution for 14 years was calculated and identified in the table below.

[18] In addition to using the business requirements to evaluate ACCESS, the CIS Project Team used the same business requirements list to evaluate various CIS alternatives. The business requirements provide the foundation for the anticipated acquisition, design, development and testing of new CIS systems and applications.

© Copyright 2008 Bass & Company. Unpublished work. All rights reserved.

1. Benefits of Outsourcing

   - Support – An outsourcer, under a proper contract, is required to maintain and support the application to a specific set of service levels.
   - Upgrade Path – An outsourcing arrangement provides an upgrade path, which does not require significant re-investment or major systems initiatives.

2. Risks & Issues

   - Partner Viability – One of the key considerations is choosing a vendor that will remain a partner throughout the life of the contract. There have been many outsourcing ventures that have been abandoned in the last 5 years.
   - Cost – The major selling point of outsourcing is converting a large up-front investment and long-term fixed costs into variable costs. In the short-run, outsourcing is a lower cost proposition but the aggregate costs of outsourcing over the long term exceed the costs of the other options.

Based on the overall considerations and risks associated with outsourcing as well as the notably high cost, the CIS Project Team did not pursue this as a viable option.

B. Alternative 2 – Internally Design and Build a Custom CIS

Another option examined by the CIS Project Team was to internally develop a custom CIS. The team determined what was required to develop a custom CIS in order to meet the requirements identified by key users. This option was originally considered as a comprehensive method of solving the technological obsolescence of both COBOL and IMS, the underlying technologies of ACCESS, while also meeting both customer needs and business requirements.

This alternative would entail developing and delivering a new system designed to support the features and functionality desired by Hawaiian Electric today. The development would replace the current technology, create an end-user interface, and replace the underlying database and database structure – in essence, performing a "complete overhaul" of the existing system.

In order to develop a custom system, Hawaiian Electric would need to engage in a complex and lengthy software development process that would need supplementing by a large pool of external IT resources. The cost of this approach was projected to be a cumulative $59.6 million over 14 years, and the development work was projected to take 6 years.

© Copyright 2013 Bass & Company. Unpublished work. All rights reserved.

1. Benefits of Custom Building a CIS

   - Ability to address company and customer-specific requirements – As with all custom system development projects, custom designing a system guarantees the highest degree of fit with existing customer and business requirements.

2. Risks & Issues

   - Cost - This option was substantially more expensive than the package solution.
   - Development Time - A customer-designed system was to take 6 years – three times the implementation time associated with the package solution. Future changes would also have to be made at standard development intervals – which would likely be as time consuming and complex as the original development effort.
   - Complexity - Hawaiian Electric is in the business of serving the energy demands of our customers. Hawaiian Electric's core competency is not software application development, nor is the company staffed to operate a software development organization. Hawaiian Electric is not in the position to develop the best CIS solution at a reasonable cost. A number of larger utilities have attempted to develop an in-house, customized solution only to end up spending significantly more resources and money than a package solution for similar functionality.
   - Skill Deficit - In order to develop a custom CIS, Hawaiian Electric must rely extensively on outside resources. Hawaiian Electric would continue, however, to depend on its existing and future pool of skilled IT / COBOL programmers. As noted, these resources have become increasingly scarce and are not anticipated to increase in the future.

The CIS Project Team concluded that this option is too risky and expensive to reasonably pursue.

C. Alternative 3 – ACCESS Modification Approach

The CIS Project team examined modifying ACCESS to address the current critical gaps in system functionality. The team relied on the current ACCESS support staff from the ITS organization to provide the status of the current technical environment and the technical limitations of ACCESS.

Based on user input, the CIS Project team developed a comprehensive list of modifications, both technical and functional, that need to be made to ACCESS. These modifications were then grouped together to form modules or projects related to business requirements and

© Copyright 2008 Bass & Company. Unpublished work. All rights reserved.

customer expectations. At this time, sixteen (16) projects have been identified and are considered crucial to satisfy customer or user demands. These 16 projects are listed below.

- Expanding the IMS Database to accommodate additional fields
- Interfacing ACCESS to the planned OMS
- Expanding the number of online system pages
- Interfacing ACCESS to the planned Advanced Metering
- Expanding bill calculation functionality
- Modifying ACCESS to support Power Line Communication
- Changing the bill format to make bills easier to read
- Improving the tracking and management of service orders
- Improving customer management functionality
- Automating form letters
- Enhancing credit & collection controls and processes
- Improving the cancel/rebill process
- Allowing customers to pay any day
- Implementing alternative payment plans
- Controlling simultaneous updates
- Improving the payment posting hierarchy

Even these modifications do not reflect the complete set of requirements gathered from Hawaiian Electric end users and customers. When implemented, these modifications will only address 53% of the 645 requirements that were gathered.

Because this is a modification of the current ACCESS application, the modifications will continue to be written in COBOL and will continue to use the IMS hierarchical database. Continuing to write program modifications in COBOL perpetuates the use of a programming language that is becoming increasingly obsolete as the Companies reported earlier, only 15% of the new software developed by 2005 will be written in COBOL. Evidence that other software languages are gaining in popularity is the fact that Hawaiian Electric's recent survey of the major universities here in Hawaii, indicates that they are no longer offering programming classes for COBOL.

Like COBOL, the IMS database is difficult to use and does not have the flexibility and ease of use as the more modern relational databases. Because of the limitations of the IMS database structure and because many programs in ACCESS are intertwined with each other so that data can be shared across databases, changes in one area of the program can result in unintended consequences in other parts of ACCESS. In fact program bugs can be

© Copyright 2003 Bass & Company. Unpublished work. All rights reserved.

unknowingly injected into ACCESS by the new applications causing inadvertent problems in other areas.

As indicated earlier, the IMS database is difficult to use to prepare reports or to make ad hoc inquiries so that information contained in the database can be obtained. This problem will continue to exist as long as the IMS database is used. Changes to how information is stored in the database can be made to facilitate the report function. However, a complete knowledge of the entire database is needed to write a report application that might require combining data from many different databases. This makes it difficult for a novice user to write an application to execute an ad hoc inquiry of the database to address an issue or concern raised by a customer.

In conjunction with HECO's IT staff, a project plan was developed that sequenced the modifications based on if the change could be made independently of other changes; if the modification was required to coincide with external planned systems (i.e., Outage Management System); or based on the estimated resource requirements necessary to complete the change. The resulting timeline with dependencies and resource estimates ran for nearly 12 years before the currently requested system modifications were completed. Attempts to shorten the project duration increased the risk of errors. This 12-year timeline means that manual processes or workarounds will continue to be used until the modifications can be placed in service. Additionally, as new company programs are developed they will either be added to the list of program modifications or will supersede another application that is waiting to be developed. In either case, the possibility of creating a backlog of program modifications will certainly be an issue. It is further recognized that these modifications are addressing requirements gathered from customers and users today. It is unclear how those requirements will change over the intervening 12 years. By the time these modifications are in-place, it is possible that they will be obsolete.

Equally importantly, however, is the fact that this system will become more and more difficult to maintain and fewer resources will be available with the necessary knowledge to maintain the system. As was pointed out earlier, there will be fewer and fewer people that are knowledgeable in COBOL and the IMS database.

1. Benefits of Modifying ACCESS

   - Lowest Cost Alternative – The modification of ACCESS is potentially the lowest cost alternative evaluated. No initial up-front capital investment is required.

2. Risks & Issues

   - Business Requirements. - While modifications to ACCESS will improve the functionality available in ACCESS, they will not meet all of Hawaiian Electric's business requirements and customer expectations in a timely fashion. At some point the cost of the modification effort will outweigh the revenue or customer service

© Copyright 2003 Bass & Company. Unpublished work. All rights reserved.

benefit that HECO achieves. The development and implementation time for the modifications is long - risking that the modification, once implemented, may no longer meet the user's or customer's needs. The development and implementation time does not allow time for any new business requirements or business needs that might arise during the next few years. If the schedules are modified to meet any new requirements (that develop over time), the delay in the delivery of basic business requirements will be longer than originally planned.

- Technology - The modifications to ACCESS will not eliminate the primary source of risk and inflexibility in ACCESS - the underlying technology (COBOL and the IMS database). As modifications are made to the core application, the risk of system failure increases significantly. Due to the complexity of the current system, the potential to introduce programming errors is significant. ACCESS is the system responsible for producing timely and accurate bills and providing customer service, it is important that it remain stable in order to bill and meet Hawaiian Electric's core obligation to its customers.
- Professional Support - There will be continued risk related to hiring and retaining skilled staff to develop and support ACCESS as the system continues to age. The issues related to professional support and staffing could jeopardize the modification project. By taking on the tasks associated with the design, development, and delivery of the modifications, Hawaiian Electric will be taking on the tasks and deliverables associated with a "software development shop." Software development and delivery is not a core business of the company. Personnel involved in these modification projects will not be available to address other needs for Hawaiian Electric's core business. Either more personnel or contract programmers will need to be hired to assist with the development or maintenance of other programs that Hawaiian Electric relies on.
- Investment - Hawaiian Electric will not avoid the need to replace ACCESS at a later date. The investment in modifications to ACCESS would be a "band-aid" approach to the core problems. By the time that the modifications are complete, the ACCESS technology and platform will be 24+ years old.
- Delays Replacement - Modifications to ACCESS will only allow Hawaiian Electric to delay the purchase and installation of a new CIS system. New functionality that will address ACCESS' current

© Copyright 2003 Bass & Company. Unpublished work. All rights reserved.

deficiencies will be implemented incrementally over a longer period of time. Modifying ACCESS postpones for 9 to 12 years what is inevitably expected to occur which is the further decline of mainframe applications. Users are becoming increasingly accustomed to Windows-based software and the ease at which they are able to navigate to different screens. Other technical applications such as the Energy Management System and the Outage Management System have been converted to a Windows based system by some vendors because of the flexibility and ease of use that the system provides.

Given the shortcomings of COBOL and the inflexibility of the IMS hierarchical data structure that prevents Hawaiian Electric from responding quickly to changing consumer demands and its desire to implement new programs, this alternative should not be pursued.

D. Alternative 4 – Purchase & Configure a Commercially Available Pre-packaged CIS Solution

The fourth alternative that the CIS Project Team considered was the replacement of ACCESS[19] with a prepackaged CIS solution. The CIS Project Team reviewed replacement CIS products to determine if they would satisfy Hawaiian Electric's needs for functionality, timely implementation, reasonableness of cost and reliability.

The CIS Project team found that new CIS systems/applications offer significant improvements over past CIS. Vendors have developed flexible and configurable applications that meet both current and future functional needs. In addition, vendors are constantly developing and introducing improvements to their applications to take advantage of new technologies and respond to customer demands.

This alternative will provide approximately 87% of Hawaiian Electric's business requirements. Equally important, the speed of availability reinforces the benefit of the CIS Purchase Option. A new CIS can be implemented within 2 years, compared to the 12 years it would take to modify ACCESS. In short, Hawaiian Electric obtains 55% more functionality than the current system, and 34% more functionality than the Modification Approach, six times faster. Furthermore, new CIS systems have the flexibility to adapt rapidly to industry, market or regulatory changes.

The CIS Project Team evaluated new CIS applications in light of both critical deficiencies and business requirements functionality. In both cases, the new systems performed significantly better than the ACCESS Modification Approach. Furthermore, the speed of implementation and superiority of the technical capabilities led the Team to favor installation of a new CIS. Finally, although it appears to be less costly to modify ACCESS, the extremely short implementation time for a new system provides full functionality in two years – ten years earlier than modifying ACCESS would allow.

---

[19] A request for proposals was sent to 22 Customer Information System vendors to determine what the product offerings were. Of the 22 companies that received the request 13 companies responded.

© Copyright 2003 Bass & Company. Unpublished work. All rights reserved.

The major CIS products available on the market today provide similar basic features. These features include: multiple service billing for metered and non-metered accounts; bill settlement; flexible rates and non-conventional (complex) price offerings; meter management; contract management; service order processing; credit and collections; payment plans; deposits; correspondence; transaction history; and Internet access. However, the core modules of a typical CIS are the customer management and billing modules. These systems attempt to simplify complex charge handling, billing, and service request transactions while allowing real-time interactions with customers. The CIS serves as the hub for all other modules that are integrated into a total solution package. By and large, today's CIS systems include:

- Customer management systems for tracking, organizing, controlling, and recording customer contacts. Allows the creation of one unique record for each customer, creating a seamless flow of information from one account to the next (i.e. if a customer moves).
- Billing module that provides interval data management, complex billing, and contract settlement solutions for utilities and other energy suppliers.
- Workflow functionality that allows real-time work assignment, tracking of those work assignments, and easy routing.
- End-user interface application that enables end-users to specify which data they want displayed and is easily accessible. This application can be unique to individual business requirements.
- Systems interface toolkits that allow the integration of disparate applications across the organization that must share information. Examples include CIS interfaces to Field Services software, handheld meter reading devices, Telecommunications, and Outage Management Systems.
- Credit and collection management features that include credit scoring for classification of customers and automated collection management processes.
- Financial management functionality, such as the ability to track customer balances, generate correspondence, offer multiple payment methods and provide financial reports for internal use.
- eBusiness capability to provide customers Internet access to their bills and to make payments over the Internet.

© Copyright 2003 Bass & Company. Unpublished work. All rights reserved.

1. Benefits of Purchasing a Commercially Available Pre-packaged CIS

Some of the key elements considered by the CIS Project Team in relation to the replacement of Hawaiian Electric's CIS system:

- Business Requirements - New CIS systems can fully or partially meet the vast majority of Business Requirements. Leading vendors develop and support software for many utilities across the industry and as part of their service provide updates and offer new functionality to their clients reflecting market changes. The implementation schedule for a new CIS system is quite rapid, allowing Hawaiian Electric to meet the needs of its users and customer in a timely manner.
- Technology - A new CIS system will be based on current technology. Vendors have broad and deep technical expertise. It is their responsibility to maintain this important and complex aspect of their systems. They can provide expertise when requested by the client.
- Professional Support - By purchasing an application from an outside vendor, Hawaiian Electric avoids the difficult human resources problems it has with maintaining ACCESS. Hawaiian Electric does not have to take on the tasks associated with a software firm: the design, development, and delivery of software modifications. Software development and delivery is not one of the goals of the company.
- Investment - The cost of a Commercially Available Pre-packaged CIS system is less expensive than two comparable alternatives: outsourcing its CIS and rewriting the current CIS. These alternatives were rejected early on because of their cost, but remain legitimate benchmarks for pricing of the CIS Purchase alternative. The cost to modify ACCESS is lower than the purchase of a replacement system. However, if Hawaiian Electric were to modify the system, by the time that the modifications were complete, the ACCESS technology and platform would be over 24 years old.

2. Risks & Issues

- Implementation Risks – CIS implementation projects require careful planning and management. Appropriate staffing and preparation are necessary to reducing the risk of implementation failure.
- Vendor Viability – The vendor selection process must include an assessment of the long-term viability of the vendor. Although several vendors have been in the marketplace for many years, a few vendors

© Copyright 2003 Bass & Company. Unpublished work. All rights reserved.

are start-up, private enterprises that have a higher risk of failure. The CIS Project team recognizes this risk and will appropriately weight the vendor's strength and outlook when making a final selection.

VII. Conclusions & Recommendations

After a comprehensive review of ACCESS, the CIS Project Team recommends purchasing and configuring a new commercially available pre-packaged CIS to replace ACCESS. While cost was a primary consideration in making this recommendation, other issues became increasingly important to the decision to recommend a new system. Specifically, the number and magnitude of the issues beyond price simply surpassed the price difference between modifying or rewriting ACCESS and purchasing a new system. The issues and their relevance to the CIS Project Team's recommendation are described below:

- Customer expectations. ACCESS is currently unable to meet customers' needs and expectations and it will take years before Hawaiian Electric is able to make modifications that start to address these needs. Hawaiian Electric's customers should have a system that can take care of critical customer information, preferences, service requests, and provide new and improved service and options. ACCESS simply does not and may never be able to fully address these shortcomings.
- Software development. Hawaiian Electric is a customer-focused electric utility. It is not, and will never be, a software development firm. While the company has experience with ACCESS as part of its primary responsibility, Hawaiian Electric is neither staffed nor able to develop software on a turnkey basis. There is substantial implementation and business risk to the utility if it is determined that Hawaiian Electric should modify the system in-house. More importantly, not only is the company unable to create a viable new CIS system, doing so would take longer and cost more than it would for the vendors to provide such a system.
- Reasonable implementation. Changing legacy CIS systems takes time, and with large modifications, each change must be installed one at a time to ensure reliability. New modular CIS systems provide greater flexibility to respond quickly to business or regulatory initiatives involving billing, metering, customer information, and reporting. The faster implementation is a result of the modular approach taken by vendors committed to software development and the highly skilled pool of programmers hired to write the software.

© Copyright 2003 Bass & Company. Unpublished work. All rights reserved.

They can design modules that apply to many companies and integrate them into each utility's software package as requested.

- Limited resources: HECO has a capable, but small CIS and Information Technology support staff, designed to maintain systems rather than build them from scratch. The extensive requirements envisioned by the CIS project team require a large resource commitment over many years to develop in-house. Modifying ACCESS would depend upon bringing together scarce internal and external resources under a Hawaiian Electric project team for a period of up to 12 years. Rewriting ACCESS though projected to take about 6 years would require this small group to work full time on the software coding. Continuity of a project of this complexity for an extended period is a major concern.
- Business risk: Hawaiian Electric is vulnerable to eroding system performance and even possible failure by relying on old and inflexible systems. As resources are diverted from normal system maintenance to modify the system, this risk increases.
- Reliance on a few highly trained resources: Since Hawaiian Electric is focused on system maintenance and reliability, only a few individuals (in Customer Service and the Information Technology group) understand all of ACCESS' functionality. Its current functionality has evolved to meet previously unanticipated needs. As a result, incremental programming over the last 12 years has added significant complexity to the original system. Over 1 million lines of code and only a few knowledgeable experts puts Hawaiian Electric in a position of unacceptable risk should the company lose these resources. It also complicates interfaces and changes to the system, since a small change in programming could have unintended consequences to related applications.
- Integration of new systems: Hawaiian Electric operates numerous individual business applications that must communicate between themselves, data warehouses, commercial off-the-shelf applications and the Internet in order to connect employees, customers, and suppliers. Furthermore, Hawaiian Electric has new strategic initiatives to improve reliability for the company that it plans to integrate into its Information Technology system. The complexity of integrating these new systems into the existing code will be challenging. Documenting, maintaining, and updating these interfaces will be an ongoing

© Copyright 2003 Bass & Company. Unpublished work. All rights reserved.

challenge for the organization that will be mitigated by a packaged CIS.

Chart 1 - Comparison of Alternatives

Option	Cumulative Cost *	Time to Complete	Full Functionality
Current ACCESS System	N.A.	N.A.	32%
Outsourcing CIS	$48.4 - $88.2 m	.75 yrs	79%
Internally Build CIS	$59.6 m	6 yrs	100%
Modify ACCESS	$20.9 m	12 yrs	53%
Purchase CIS	$31.4 m	2 yrs	87%

* Includes selection, development and on-going maintenance costs for 14 years

VIII. CIS Selection & Implementation

Based on the recommendations in the previous section, the next steps in the process are to select a CIS system and implement. The whole process from selection through implementation is expected to take between 22 and 24 months based on project plans developed by the CIS Project Team and Bass & Company experience with other CIS implementations of the same size and complexity. While shorter project timelines are possible, greater risk of potential failure and cost overruns exists if any phase, from product selection through configuration and testing are rushed. The overall project timeline is in the table below.

Task	Approximate Time to Complete
CIS Selection and Installation Preparation	5 months
Analysis	3 months
Design	4 months
Development and Testing	8 months
Deployment	2 months
Post Implementation Support	2 months

A complete description of the phases of the project is detailed in the following sections.

A. CIS Selection

The selection of the CIS system encompasses more than just determining application fit to business requirements. It is also extremely important to evaluate the capabilities and long-term viability of the vendor in order to avoid problems with the vendor over the life of the contract.

1. The Request Process

The best way to identify both application fit and vendor viability is through a formal Request process. There are three types of Requests; Request for Information ("RFI"), Request for Quotes ("RFQ") and Request for Proposals ("RFP"). The first request, the Request for

© Copyright 2003 Bass & Company. Unpublished work. All rights reserved.

Information or RFI, is the most flexible of formal requests. The RFI can range from a request for basic application functionality all the way to detailed application functional requirements. RFI's are typically used in the early stages of vendor and application selection but when used in conjunction with the Request for Quotes, can be a substitute for the more formal RFP. The Request for Quotes is a request for product or application pricing. When used alone, an RFQ will contain basic product specifications to help vendors develop a pricing quote. When combined with the RFI, the RFI/RFQ package functions as an RFP, providing detailed specifications and requirements that vendors use to develop pricing estimates. The Request for Proposals (RFP) is the most formal of all requests. RFP's typically contain very detailed requirements and specific contract terms that vendors must adhere to. RFP's are used when capital expenditures have been approved, the utility plans on making a vendor and system selection within 6 months and the utility has not previously issued an RFI or RFQ.

Regardless of the type of Request used, the Request process is necessary to narrow the field of vendors to those that meet the specific needs and requirements of the utility. The responses received from the vendors are evaluated for compliance, completeness of answer and degree of fit to the requirements. In addition, vendor financial stability and experience with implementations of the same size and nature to Hawaiian Electric as well as long-term product strategy are taken into consideration to arrive at a short-list of viable vendors.

In Hawaiian Electric's case a combined RFI/RFQ was used since it was necessary to survey the market as to viable vendors and available CIS functionality but regulatory approval had not been granted as of the date of this study. Following the development of functional and technical requirements in December 2002 and January 2003, the CIS Project Team issued a Request for Information/Request for Quote (RFI/RFQ) to 22 vendors on February 7, 2003. Vendors were given three weeks to prepare a response. Of the 22 vendors solicited, 13 responded.

Vendors were also requested to provide pricing for two different alternatives: installation of a licensed version of the application on Hawaiian Electric computer facilities, and an Outsource/Application Service Provider (ASP) approach where Hawaiian Electric uses of the application and pays a recurring transaction fee.

The cost range of the 13 respondents was broad. To narrow down the field of 13, the CIS Project Team defined criteria by which vendors' estimates would be assessed. The criteria include:

- Installation at a regulated utility of similar size to Hawaiian Electric
- Overall vendor cost and the cost of the software license
- Availability of US-based development and support staff
- Technology that is consistent with Hawaiian Electric's current and planned IT initiatives.

© Copyright 2003 Bass & Company. Unpublished work. All rights reserved.

Of the 13 vendors who responded, 8 were eliminated from consideration for not meeting one or more of the criteria. Five vendors met the qualifications listed above. The CIS Project Team, through the vendors' responses, is confident that the vendors included in the shortlist can meet the requirements, timeframe and cost projections as outlined here.

2. Application Testing and Product Selection

The next step in the selection process is to test the application against selected major business processes. This is necessary to ensure that the responses given by the vendor to the RFI/RFQ fairly represent the application's functionality. Before the vendor products can be tested, Hawaiian Electric must document their required and desired business processes, policies and procedures. This documentation is extremely important during both vendor selection and system implementation. Examples of major business processes include, but are not limited to:

- Establishing a new customer
- Generating bills
- Providing customer service
- Managing Accounts Receivable

For each process, business rules or policies and detailed procedures will be documented by the project team. Therefore, it is important to have participation on the team from all functional areas impacted by the new CIS.

During vendor selection, it is this Policy, Process and Procedure documentation that the vendor applications will be tested against. Without this documentation, Hawaiian Electric will be unable to determine which product is best suited to support the business functions. During implementation, the Policies, Processes and Procedures are used as the "blueprint" from which the system is designed and configured. Without the documentation, Hawaiian Electric would not know how to configure the system to perform such functions as generate a bill, process a payment, set up a credit arrangement, or initiate a high bill investigation. As will be explained further, new CIS applications use configuration tables to set parameters for things like when a bill is due or when a notice is sent. If Hawaiian Electric does not document its policies, processes and procedures prior to configuration, much time will be wasted determining how to configure the CIS and testing the configuration to ensure that the software does what Hawaiian Electric wants it to do. Configuring the system without documented Policies, Processes and Procedures is like building a house without blueprints.

From this complete set of policies, processes and procedures, each vendor will be provided a limited number of specific business processes and test data and will be required to demonstrate how the system completes the business process. Examples of specific business processes that could be used in the application test include:

- Establishing a new customer

© Copyright 2003 Bass & Company. Unpublished work. All rights reserved.

- Calculating a Time-Of-Use invoice
- Responding to an outage
- Setting up a credit arrangement
- Posting payments

These are just 5 examples of the many business processes that could be used to test the vendors' applications. Once this information is provided, the vendors will be required to physically demonstrate how the system supports the identified process using currently available software on Hawaiian Electric's facilities.

All short-listed vendors will be extended an offer to demonstrate their system in this manner. Members of the CIS Project Team, end-users, project sponsors and other interested parties will view the demonstrations and score the vendor's ability to support the business process. In the end, the vendor and application which best supports the business processes will enter into the next step of the vendor selection process – contract negotiation.

3. Contract Negotiation

Once the best product emerges from the application testing process, Hawaiian Electric will enter into negotiations with the vendor for successful delivery and implementation of the new CIS. It is crucial at this step to ensure that all parties involved in the implementation, whether the vendor or other professional services firms engaged in the delivery of the CIS, are focused on the overall objective – successful implementation of the new CIS in a timely and efficient manner. In order to achieve this, specific targets related to timing of milestones and costs will be contracted for with penalties and incentives for missing or achieving the target, respectively. For example, specific milestones could be the following:

- Delivery and installation of the software on Hawaiian Electric facilities
- Completion and sign-off of the configuration specifications
- Completion and sign-off of the system tests
- Completion and certification of user training
- System in production

Tying the vendor and other third-party's success to the success of the project ensures consistency of goals and objectives across the project. All parties will be contracted with in this manner.

B. Implementation

Implementation will take place over 5 distinct phases, Analysis, Design, Development and Testing, Deployment, and Post-Implementation Support.

© Copyright 2003 Bass & Company. Unpublished work. All rights reserved.

Crucial to each phase is project staffing. A full-time CIS Project Team responsible for the successful implementation of the system will consist of project managers from Hawaiian Electric, the vendor and other third-party professional services firms necessary to oversee the resources responsible for implementing the system. In addition, leaders of the technical team and the business/end-user teams will round out the full-time CIS Project Team.

Beyond the full-time project team, the project will require business representatives from the departments that are users of the system and subject matter experts in their areas of expertise. Such expertise is typically necessary from the Customer Contact Center, Credit & Collections, Billing, Accounting, Energy Services, System Operations and the technical areas of data conversion and interfaces. Although not assigned to the project on a full-time basis, these experts and business representatives will be required to assist the project at critical points in the timeline; analysis, design, system testing and training.

The approach taken towards staffing the project team was to use internal resources to the greatest extent possible and fill in the remaining project team openings with external resources from either the vendor or other third-party professional services firms. The reason for this is to ensure that the new system is adopted by Hawaiian Electric quickly after implementation. By using internal resources, Hawaiian Electric employees gain significant experience and understanding of the system, its functionality and configuration. This intimate understanding of the system will enable the members of the project team to gain a level of knowledge of the system far exceeding that delivered during training. After implementation, the project team members will help others learn how best to use the system. If the project team members were primarily vendor or third-party resources, this expertise and knowledge would be lost as the project ended.

As mentioned above, the 5 phases of the implementation effort are:

- Analysis – Determine the changes in the system necessary to meet the full set of functional requirements
- Design – Document and sign off on the detailed specifications or "blueprints" necessary to configure the system
- Development and Testing – Configure and test the system
- Deployment – Convert the old data to the new system and roll the system into production.
- Post-Implementation Support – Help the users get acquainted with the system and resolve production errors.

These phases are discussed in more detail in the following sections.

1. Analysis

The first phase of a CIS implementation is crucial to the overall success of the effort. Being thorough and complete at this stage will ensure that the remaining phases are smooth and efficient. The primary effort that takes place during this phase is a gap analysis. The gap

© Copyright 2003 Bass & Company. Unpublished work. All rights reserved.

analysis identifies the changes that need to be made in the application, either through configuration or modification to the code, in order for the system to fully support Hawaiian Electric's requirements. These "gaps" may be simply configuring the system that payments are due 16 days after bills are printed. Conversely, the "gaps" may be complex issues like the system needs to be able to handle multiple reads from Time-of-Use meters. By identifying the gaps, the project team will understand and document how much work will need to go into the configuration to get the system ready for production. Unlike the application test that takes place during system selection, the gap analysis is a complete, end-to-end evaluation of the system. Failure to fully evaluate the system during this phase will result in unforeseen problems that appear during system testing. The end result of shortcutting the analysis phase will be an increase in the cost and the time to implement.

Unlike most software that is purchased from a computer store, such as a game or a "how to guide", the CIS software is not usable "out of the box". The CIS software license fee buys the right to use the software but the software that is shipped must be configured prior to use. Similar to a blank spreadsheet in Microsoft Excel™, a new CIS program that has not been configured and populated with valid data will not function. It will not produce a bill; support a customer request; initiate credit and collections; nor will it provide information during an outage. The new CIS program must be configured to address the Hawaiian Electric's particular needs. The system must be configured to bill, collect, provide information and manage accounts commensurate with regulatory rules, company policies, processes and procedures.

Current CIS software has been developed to handle a wide variety of different customer and operational situations in order to minimize custom program modification on every installation. All CIS program vendors provide core systems that contain the basic code and algorithms to establish generic operating processes such as managing customer accounts, calculating charges, presenting a bill and managing payments. The software, however, is intentionally generic, as the CIS needs to be able to support the needs of a diverse array of utilities. Since no utility operates with the exact same parameters as another utility, CIS software allows for, and requires configuration to the operating parameters specific to the utility. For example, the CIS software must be configured so that it can comply with operating parameters such as *how* to calculate charges, *when* to produce bills, and *in what order* to post payments. This task is not as simple as it might seem. Seemingly simple configuration questions such as "How many different customer types do we have?" or "How many different charge types do we have?" may have complex considerations.

The following example illustrates why configuration of the system is an expensive and a time intensive activity. The table below contains examples of the different parameters that would be configured during implementation:

© Copyright 2005 Bass & Company. Unpublished work. All rights reserved.

Parameter	Valid Values
Customer Types	Residential Commercial State and Local Government Military Life Support
Charge Types	Deposit Electric Commodity Late Payment Non-Commodity Charges
Companies	HECO MECO HELCO
Credit Code	1 = High Risk 2 = New Customer 3 = Low Risk
Late Payment Charge	1% of outstanding balance

In this illustration, 5 different customer types, 4 different charge types and 3 different companies produce 60 unique charges that can be categorized into 3 different risk categories for 180 unique combinations against which different rules relating to late payment charges, collections and disconnection can apply. For example, if a residential customer does not pay their electric bill on time, a 1% late payment charge will be levied on the outstanding delinquent balance and, depending on their credit code, a notice will be sent reminding the customer to pay their bill or face disconnection. After a certain number of days, a disconnection notice will be sent to the customer. Failure to pay the bill will ultimately result in disconnect. These collection and disconnection rules can be different for each company, each customer type, each charge type and each credit code. It is not uncommon for a CIS to have up to 100 master tables and 200 or more sub-tables that define anywhere from two to hundreds of different valid values per sub-table. This can yield more than 2,000,000 unique combinations against which the operating parameters are applied.

© Copyright 2003 Bass & Company. Unpublished work. All rights reserved.

It is because of the risks of not performing this thorough, end-to-end evaluation of the system during Analysis that full participation is required by business/end-user representatives and subject matter experts. All areas need to participate to ensure that the gap analysis covers all aspects of the application. In addition to the business/end-user representatives and subject matter experts, system experts from the vendor as well as facilitators are required to accurately represent the system functionality and document the gaps. In addition, the high-level approach to data conversion and interfaces will be defined during this phase.

In summary, the activities that take place during Analysis are:

- Install the Base CIS Product. The CIS product, in its base form, will be installed in Hawaiian Electric facilities. The base product will be configured and added to during the remainder of the project. Hardware, operating system and database management software will be required at Hawaiian Electric.
- Conduct the Gap Analysis. The project team will determine what changes or settings must be made to the base CIS to enable Hawaiian Electric processes and business rules. For example, the team may define the number of credit extensions that will be allowed for different customer types and determine what CIS settings will be needed. The decisions made during this activity determine what functionality the CIS will have when it goes into production. This activity will entail significant participation from business subject matter experts.
- Define the Data Conversion Requirements Specification and Approach. Correct population of the CIS database with sufficient information is critical to the success of the project. The approach – migration of data all at once, staggered migrations, etc – affects the schedule and the cost and realization of benefits from the project.
- Develop External Interface Requirements Specification and Approach. The CIS must interoperate with many other Hawaiian Electric systems, such as the Outage Management System and the Interactive Voice Response system. During this stage of the project, the specific systems with which the CIS must interface and the technical architecture of the interfaces will be defined.

2. Design

Once the gap analysis is complete, this information is used to build the design specifications, or "blueprints" necessary for the technical team to configure or modify the system to meet

© Copyright 2003 Bass & Company. Unpublished work. All rights reserved.

the functional requirements. Again, a poorly conducted gap analysis will result in poorly designed specifications. The design specification will identify components of the system that need to change and how it needs to change. This also includes any peripheral systems that are required to support a function or applications that will interface with the CIS such as cash processing, metering, field service management, general ledger and outage management systems. One other crucial element of the design phase is the development of the initial test plans in conjunction with the design specification. As functions of the system are identified as requiring change, test plans are documented to certify that the proposed change was modified or configured correctly.

During the Design phase, project team involvement will primarily consist of the technical teams and the vendor-supplied application experts. The team leads of the business/end-user teams will be consulted for clarification on configuration and modification requests. The result of this stage is a full documented and signed-off design specification that can be used by the technical team to build and implement the requested changes.

In summary, the Design phase will consist of the following activities:

- Develop Application Specifications. The 'gaps' identified during the prior phase require closure to enable the team to deliver a system that will meet Hawaiian Electric's needs. It should also be noted that the CIS would, most probably, continue to be amended throughout its use. Detailed specifications are needed to enable both to occur. The specifications will provide detail for development and unit testing of changes, configuration settings, and add-ons to the CIS.
- Develop Data Conversion Specifications. The data conversion design specifications will address three topics: mapping of data from the old database to the new, determination of data conditioning requirements and means to cleanse such data, and specification of validation and testing rules for the cleansed and converted data.
- Develop System Interface Specifications. Design specifications upon which interface application code will be based will be created. Also, document unit test plans that will be used for initial testing of the interfaces.
- Develop Test Designs. As noted above, unit test plans will be developed in concert with design specifications. Additional degrees of testing will be required to validate the functionality, acceptability, and readiness of the CIS and its data. These include performance testing to validate the capacity of the CIS; integration testing to validate the interoperability of the CIS components, the components and data, and the interfaces; and user acceptance testing to validate that the total

© Copyright 2003 Bass & Company. Unpublished work. All rights reserved.

system meets predetermined acceptance criteria. During this activity, the specifications for these three variants of testing will be developed.

3. Development and Testing

At this stage of the implementation, the technical teams take the design specification and make the configuration changes or modifications detailed in the specification. Similar to carpenters framing or plumbers plumbing a new home, now is not the time to be changing the design. The majority of this effort consists of programmers performing the configuration or coding work as documented by the Business/End-Users and the subject matter experts.

Changes in the design during this phase will delay programming and testing, potentially delaying the overall project. While programmers are configuring or modifying the system as detailed in the design specification, training programs and materials are being developed that will be used to train all end-users.

The final major task of this phase is testing. There are three critical tests that need to be completed before the system is ready for production: Performance Testing, Integration Testing and User Testing. Performance Tests focus on those functions of the system that process large volumes of transactions like Billing, Payment Processing and Service Orders. Using test data, these functions are tested for transaction processing time, maximum throughput and performance impact to the system when processing transactions under load. Performance testing is also known as "Stress Testing" as the system is placed under maximum "stress" to see if it can handle the highest transaction volumes Hawaiian Electric expects the system to support in any given situation.

Integration Testing focuses on those areas of the system that interface or integrate with other applications. Examples include the CIS interfaces to the General Ledger, Field Management System, Outage Management System and Payment Processing. Integration testing ensures that CIS can transfer data to and from these systems without error in order to seamlessly complete transactions. In addition, full integration testing seeks to ensure that not only can the CIS send and receive data to and from other applications, it also tests the other applications' ability to use this data to complete the transaction without manual processing.

User Acceptance Testing is when the system is placed before the business/end-user team to ensure that what was designed was delivered according to the expectations of the team. User Acceptance Testing uses the business processes documented during the Analysis Phase to test the functionality of the configured system. During testing, the Business/End-User team is expected to sign-off on the test certifying that the system is ready to be deployed. If

© Copyright 2003 Bass & Company. Unpublished work. All rights reserved.

the team does not approve of elements of the configuration, the necessary changes are documented and implemented by the technical team. The functionality is then retested until the Business/End-User team is satisfied with the results.

During the testing tasks of this phase, the technical team plays a key role during the Performance and Stress Tests and the Business/End-User team in conjunction with the technical team supporting the User Acceptance Test. At the conclusion of this phase, the system has been certified ready for deployment.

In addition to the testing, training will be delivered to all identified end-users. This includes the "power" users in the call center, billing, credit, field services and system operations as well as the casual users in Energy Services, Corporate Accounting, Customer Installations, and even executive management. The CIS Project Team plans on providing 4 weeks of training for power users and 2 weeks of training for casual users. Additional training will be delivered to users during the post-implementation period.

In summary, the major tasks of the Construction and Testing phase are as follows:

- Configure and Develop CIS Components. Design specifications developed in the previous phase will direct technical staff to develop applications, configure system tables and conduct initial testing of each component of the CIS.
- Develop and Test Data Conversion. Similar to the CIS development, data conversion and conditioning applications and utilities will be developed using the specifications. In addition to unit testing of the conversion and conditioning methods, a series of pilot conversions of significant volumes of data will be executed. These pilot conversions will enable the team to validate integration of data, timing of conversion and quality of the data. The testing team will use the data during performance, integration, and user acceptance testing.
- Develop and Test Interfaces. The automated interfaces between the CIS and other application systems will be written and unit-tested during this activity.
- Conduct Performance, Integration and User Acceptance Test. Test designs developed during the previous stage will be used to identify errors or omissions in the CIS, conversion routines, and interfaces. A team largely composed of business users will execute the tests. The technical staff that developed and configured the applications will be

© Copyright 2003 Bass & Company. Unpublished work. All rights reserved.

responsible for diagnosis and correction of errors. At the conclusion of these tests, the entire system will be ready for migration to production.

- Develop Training Curricula and Materials. Effective and efficient use of the CIS and processes and procedures cannot occur without well-trained end users.
- Conduct User Training. Classroom sessions will be conducted for all CIS users. These sessions will use the aforementioned materials as well as the CIS system and data.
- Prepare Business Migration Plan and Materials. Introduction of the new CIS and retirement of the old will involve technical, organizational, and procedural activities. Its success will largely depend upon adequate and detailed planning as well as effective execution of the plans. The plans and hour-by-hour schedule of migration activities will be developed.

4. Deployment

The main task of the Deployment Phase is releasing the system into production for use by all end-users. This task predominantly focuses on the logistical tasks of ensuring that all user IDs, all computers, all data, all applications and all manuals have been distributed and the system is properly running. The CIS Project Team and all team leads take primary responsibility of completing the final "punch-list" of activities. Issue Resolution forms and a CIS Help Desk needs to be made available to identify and resolve any and all issues.

For a short period of time through this phase and potentially beyond, the old system will be run in parallel to the new system. While every effort will be made to ensure that the new system is error-free and supporting the users and the business, the old system will continue to run as a backup in case of critical failure of the new system. As soon as the new system is stable and handling the major business functions, the old system will be retired.

The other major task of this phase is conversion. The accurate and correct population of the old data in to the new CIS requires data clean-up, mapping and physical conversion of the data from the old format to the new. The conversion programs developed in the construction and testing phase will be run for the conversion of primary and secondary data.

Throughout this phase, the CIS Project Team and team leads have primary responsibility of completing the deployment tasks. In summary, the major tasks, which make up the deployment phase are as follows:

- Execute Migration Plan. All migration tasks identified in Phase 4 will be completed. These will include such things as distribution of user

© Copyright 2008 Bass & Company. Unpublished work. All rights reserved.

manuals, configuration of security profiles, internal and external communications, and environment validation.

- Migrate CIS to Production. The hardware and system software components will be configured and the application components that comprise the CIS will be configured and made ready for production use.
- Populate Production Database. The CIS will use data migrated from ACCESS into the new database. Previously developed conversion and testing routines will be executed, in accord with the conversion approach, and the data will be inserted into the new CIS database. Using the validation methods and criteria defined during a prior stage, the team will evaluate the quality and completeness of the data.
- Employ the New CIS. The final installation project activity will be to put the system into daily use.

5. Post Implementation Support

After the new system is placed in production and deployment activities are complete, the CIS Project Team and team leads will monitor the system for a period of time. Feedback and Issue Resolution forms will be distributed to end-users as vehicles to gather information related to errors or production problems so that they can be addressed and resolved as quickly as possible. In addition, a CIS Help Desk will provide phone and internet-based user support for issue resolution, ID management and functional training. The process of identifying, prioritizing and resolving issues will be formalized in order to address issues in the appropriate sequence. For example, issues that affect the ability to produce bills or system availability for end-users will take precedence over simple non-revenue or customer impacting issues such as a spelling error in a field title.

The CIS Project Team estimates this phase to be approximately 2 months. However, this phase could be considerably longer if analysis, design or construction problems are not identified and resolved during testing.

The primary tasks during this phase are listed below.

- Manage and Monitor New CIS. Once the new CIS has been installed, the system needs to be monitored to insure that the system is working as planned.
- Review and Respond to Issues. In the early stages of an installation, the post implementation support staff will need to review and respond quickly to issues, concerns, and questions as they arise.

© Copyright 2003 Bass & Company. Unpublished work. All rights reserved.

The implementation of a CIS is a lengthy and complex process. While there are many ways to organize the plan and many names by which the phases can be called, the underlying tasks and risks remain the same.

- Hawaiian Electric must first understand how it wants to conduct business given regulatory rules and business objectives.
- A full analysis of the new system's capabilities needs to be gained and thoroughly understood.
- The "design" (i.e., plans, strategies and approaches) to meet Hawaiian Electric's functional requirements, whether through configuration, modification, other applications or manual processes, need to be documented and agreed upon.
- These "designs" need to be acted upon through configuring the system, modifying the system, implementing a separate application or modifying the original business process.
- The construction needs to be tested to ensure it works and will work at the volumes that Hawaiian Electric expects.
- The old data needs to be cleaned, mapped, converted and tested in the new system. The users need to be trained.
- Finally, the system needs to be monitored to ensure that it is working and continues to work correctly.

Hawaiian Electric has approached this project in a prudent manner with thorough planning and analysis of their current situation, evaluations of existing CIS applications and detailed cost analysis of the various options available. The replacement of the CIS is the most reasonable and appropriate alternative. With proper planning and project management as evidenced in the selection and implementation plans, the risks inherent in any system replacement will be mitigated.

IX. Project Costs

The table below shows the detailed estimated total project cost for the CIS Purchase Project:

CIS Replacement Project
Project Cost

($ Thousands)

Cost Type	Total
Labor	$ 1,564
Overhead	$ 1,113
Materials	$ 546
O/S Svc	$ 12,298
Other	$ 3,492
AFUDC	$ 1,408
Total	$ 20,421

Indicator	Total
Capital	$ 631
Deferred	$ 17,652
Expense	$ 2,137
Total	$ 20,421

© Copyright 2003 Bass & Company. Unpublished work. All rights reserved.

Exhibit H

CIS Replacement Project
Alternative Cost Comparison
Assumptions

Project Alternative Assumptions:			
General Project Assumptions	1	New CIS goes live 22 months after project start up	
	2	ACCESS retired 22 months after project start up	
Maintenance Costs	1	ACCESS Support group information provided by ITS (Roger Angell)	
Year 1 - Year 3	2	ACCESS Maintenance continues until CIS go live and then ITS CIS support staff begin maintaining new CIS	
	3	Vendor maintenance is assumed at 20% of the license cost based on vendor responses ranging from 18% to 23%. Includes 24 hour access to a Help Desk to assist with any applciation problems, issue resolution/bug-fixes, support of standard interfaces and standard reporting, periodic releases of updates and upgrades.	
	4	Maintenance costs in the cashflow reflect net maintenance. ACCESS Mods reflect maintenance costs net of ITS staff assigned to development. CIS Replacement maintenance reflects internal and vendor costs net ITS staff assigned to replacement project	
	5	ACCESS Development Director assumed 25% allocation of time to management of maintenance and development staff (R. Angell)	
	6	Contract support staff assumed at $56,000 per year (R. Angell)	
	7	Monthly costs based on an annualized cost (2002 actual expenses) for maintenance divided by 12	
Hardware Assumptions	1	*Vendor Production Environment Estimates*	
for new CIS		Vendor #1 = $1.2 Million (IBM Server, Oracle Licenses, Third-Party Software)	
		Vendor #2 = $500,000 (Oracle licenses, Doc/1 license)	
		Vendor #3 = $130,000 (Oracle license)	
		Vendor #4 = $200,000 (Development server only)	
	a	$250,000 for Implementation team PCs = 50 at $5,000 each (hardware and software)	$ 250,000.00
	b	$250,000 for Miscellaneous software/hardware and contingency	$ 250,000.00
		Total Hardware estimate	$ 500,000.00

Exhibit H

CIS Replacement Project
Alternative Cost Comparison
Assumptions

		The budgetary estimates were based on the 4 short-listed vendors to reflect what we reasonably expect to pay.	
		The license fee is the fee paid to the vendor for the legal right to use the vendor's software in support of the users stated business.	
Purchase & Configure a Prepackaged CIS Solution	1	Timeline - reflects assumed time to complete tasks based on previous CIS implementation experience and vendor estimates	
	2	Staffing levels based on previous implementation experience, vendor provided information and detailed discussions with ITS (Ramona Hamasu, Brenda DeRyke) and CSD (Laurie Oishi) staff	
	3	Staffing costs are based on prevailing rates for external resources and Pillar labor rates for internal staff. All overheads are included at current overhead rates as provided by Management Accounting.	
	4	License fee of $2,000,000 was based on reasonable pricing expectations from previous CIS experience	
Internally Build a CIS	1	Assumes complete rebuild of all ACCESS modules	
	2	Requires design guide, new data model and process redesign	
	3	Maintenance costs are assumed the same as current ACCESS maintenance	
CIS Outsourcing	1	Outsourcing costs include only operating costs, implementation costs have not been estimated	
	2	Further analysis of outsourcing was stopped once the costs exceeded $40 million over 10 years	
	3	Maintenance for outsourcing was assumed to be the same as the other options	
Staffing Assumptions			
Project Manager	1	Current project manager used by CSD will be the project manager on all ACCESS modification projects requiring the position	
	2	Project Manager will be involved in project from project start up thru post implmementation support	
	3	May be full or part time position depending upon size and complexity of project	
	4	Not all projects will need this position	
Change Mangement Lead	1	Position will be filled by person within Customer Service	
	2	Involvement runs from project start up thru user training	
	3	May be full or part time position depending upon size and complexity of project	
	4	Not all projects will need this position	

CIS Replacement Project
Alternative Cost Comparison
Assumptions

Policy/Process/Procedure Lead	1	Position will be filled by an external consultant due to need for specific skills and expertise in subject area	
	2	Involvement runs from completion of requirements thru user training	
	3	Full time position	
	4	Not all projects will need this position	
Application/Technical Expert	1	Position will be filled by an external consultant due to need for specific skills and expertise in subject area	
	2	Involvement runs from project start up thru implementation	
	3	Full time position	
	4	Not all projects will need this position	
Training Supervisor	1	Position will be filled by an external consultant due to need for specific skills and expertise in subject area	
	2	Involvement runs from development of training materials thru performing training	
	3	Full time position	
	4	Not all projects will need this position	
Technical Resources	1	CSS (Customer Support Services)/EIS (Employee Information Systems) Application Affinity Group will provide 1 lead and 2 programmer analysts on a part time (50%) basis	
	2	ITS will provide a part time (50%) database administrator as needed	
	3	Additional technical resources will be provide first by TYC (2 analysts) then by Datahouse. These positions are full time positions.	
Trainers	1	For modifications that affect all three companies, one person from each company will fill these positions	
Business Lead / Analysts	1	Helco and Meco will provide a business lead on projects that affect their companies. Heco will provide a business lead and analysts as needed.	
	2	Part time or full time positions dependent upon the project	
Modification Costs			
External Consultant Costs	1	Labor rate will increase by 5% every three years based on expected contract negotiation.	
	2	Current project management rate is $100.00 per hour, no expenses	
	3	Labor rate is $72.50 per hour, no expenses - local company	
	4	Labor rate is $90.00, no expenses - local company	
	5	Fill Application/Technical Expert position with mainland consultant at $325. Hourly rate adjusted to reflect 20% expenses	
	6	Fill Policy/Process/Procedure position with mainland consultant at $250 per hour. Hourly rate adjusted to reflect 20% expenses.	
	7	Fill Training Supervisor position with mainland consultant at $175 per hour. Hourly rate adjusted to reflect 20% expenses.	

Exhibit H

CIS Replacement Project
Alternative Cost Comparison
Assumptions

Internal Labor Rates	1	Labor rates for each labor class provided by General Accounting for years 2005 thru 2013. A 3% factor was used to calculate labor rates for 2014 & 2015	
	2	2005 on costs were used for years 2005 thru 2016. On costs include: Payroll Taxes - 8.46% of hourly rate Employee Benefits - $6.48 per hour Non Production Wages - $4.02 per hour Corporate Administration - $3.01 per hour On cost rates provided by Management Accounting	
	3	AFUDC rates were provide for years 2005 thru 2008. The AFUDC rate for 2008 was used for years 2009 thru 2016. AFUDC rates provided by Management Accounting	
	4	AFUDC calculation for deferred costs must be done outside pillar. The AFUDC calculation was provided by Management Accounting.	
Miscellaneous	1	Estimated cost for printing software provded by ITS based on current quotes by Group 1 software	
Process - to calculate project cost	MS Project	Using Microsoft Project, a CIS Replacment project plan was developed.	
	Pillar Update	The project plan developed using Microsoft Project provides a resource usage report. This resource usage report was used to create a spreadsheet that contains worksheets for internal resources, ITS resources, and external resources/cost. Only internal resource costs are computed in pillar. ITS and external costs must be computed outside pillar. The computed dollar amounts are then loaded into pillar.	
	Pillar	The CIS Replacement project pillar file for June was updated with the latest project information. Pillar determines the labor rate for each internal resource based on labor class then calculates the labor cost. Pillar calculates the on costs for internal resources, stores overhead for materials, and AFUDC for capital costs. The CIS Replacement project is mainly a deferred cost project and pillar does not calculate AFUDC on deferred costs, the calculation is down outside of pillar.	
	Project Cost Worksheet #1	Pillar detail is imported into Excel to create "Project Cost.xls" workbook. Note: the AFUCD Deferred entry in the imported file is left over from the prior period.	
	Pillar	A copy of the pillar file is made and all entries are deleted from the file except for deferred items. The on costs for deferred items are calculated. This file will be used to calculate the AFUDC on deferred items including on-costs.	

CIS Replacement Project
Alternative Cost Comparison
Assumptions

	Project Cost Worksheet #2	Pillar deferred costs are imported into Excel to create "Total ND Costs" workbok.	
	Project Cost Worksheet #5.	The "AFUDC" workbook is used to calculate AFUDC on the deferred items. AFUDC rates for the years 2003, 2004, and 2005 were provided by Management Accounting. The calculated AFUDC amounts by month are then added to the AFUDC deferred item in the "Total Project Cost" worksheet. The Pillar file is also updated with the newly calculated AFUDC - deferred costs. Note: AFUDC should be expense element 430 but as a work around the AFUDC is stored as "601". Management Accounting will go into pillar and correct the expense element. Only certain people have the ability to modify expense element 430.	
Accounting Treatment of Project Costs		The CIS Replacement Project costs were developed based on the accounting standards for handling software development project drafted and proposed to the Consumer Advocate. Development of the project cost was based on the following: 1) All costs prior to vendor product selection will be an O&M expense 2) Following vendor selection, costs will be either deferred or O&M depending on the following: a) Costs to convert current system data into the format required by the new system will be O&M b) All training costs will be O&M; both development of training materials and training sessions c) All other labor costs will be deferred expenses 3) Hardware will be a capital expense 4) License fee will be a deferred expense 5) Inter-island travel, lodging, and per dien will be a deferred expense	
Installation Costs			
External Costs	1	Project manager for PUC Application project will continue as project manager for the Replacement Project. Current hourly rate is $100.00 per hour, no expenses	
	2	System Integrator Project Manager, Business Transistion Team Lead, and Functional Architect positions will be filled by Bass & Company consultants at $325/hour. Hourly rate adjusted to reflect 20% expenses	

CIS Replacement Project
Alternative Cost Comparison
Assumptions

	3	Selected vendor will provide resources for the following positions: 1) Installation Team Lead 2) Product Architect 3) CIS Programmer / Analysts (4) Installation Team Lead and Product Architect positions use a $325 per hour rate. A 20% expense rate is built into the hourly rate. The CIS Programmer Analyst positions have a $200 per hour rate. A 20% expense rate is built into the hourly rate.	
	4	Contractors, preferably local, will fill the following positions: 1) Tester - $325 per hour 2) Policy/Process/Procedure Analyst - $325 per hour 3) Data Conversion Analysts (2) - $100 per hour 4) Data Conversion Programmers (2) - $100 per hour 5) Interface Programmer Analysts (3) - $100 per hour 6) CIS Programmer Analyst - $100 per hour 7) Database Administrator - $250 per hour, estimate provide by ITS based on IBM rates 8) Technical Support - $200 per hour, estimate provided by ITS based on IBM rates.	
ITS	5	ITS has agreed to provide 4 CSS (Customer Support Services)/EIS (Employee Information Systems) Application Affinity Group members for the project.	
	6	ITS has agreed to provide, at no charge, a database administrator and technical support person to shadow and learn from the consultants hired to fill those roles.	
	7	All ITS team members have a labor class Teacher/Coach. The labor rate and associated on costs for this labor class were provided by Financial and Management Accounting.	
Contingency	10	The 10% contingency factor was estimated based on Bass & Co's previous experience with projects of this nature and their understanding of Hawaiian Electric as a business. Factors contributing to the 10% estimate are the duration (24 months), the availability of internal staff to fill key roles, the length of time required for management review and the potential for vendor cost increases due to expiration of price quotes or the inflation factors necessary to price "fixed-price" projects (vendors inflate pricing when clients demand fixed-price projects).	
Travel Expenses	11	Travel expenses are for the neighbor island staff that will be on the project. Travel expenses for external consulting is included in the labor rates and travel expenses for vendor staff are included in vendor supplied costs.	

Cashflow

COST COMPARISON OF ALTERNATIVES	Year 1	Year 2	Year 3	Year 4	Year 5
Alternative #1: Outsource CIS					
Implementation Cost	$ 433,358.23	$ 214,149.49	$ 3,465,878.43	$ -	$ -
Recurring Vendor Charge	$ -	$ -	$ 750,856.34	$ 3,059,621.79	$ 3,100,608.50

CA-IR-223

Ref: Response to CA-IR-2, HECO T-9, Attachment 2, page 3 (Contract Bill Print Costs).

Please provide a complete copy of the outsourcing contract for bill print services and explain whether HECO is obligated under the contract to continue to separately pay for envelopes, postage or bill forms after contract bill print services are commenced at the indicated monthly rate of $45,951 to HECO.

HECO Response:

HECO's obligation to separately pay for envelopes, postage, and bill forms is stated in part 1(a) on page 8 of Attachment 1, "Attachment I to Work Authorization No. 1." Attachment 1 is a confidential document that will be submitted upon issuance of a protective order in this proceeding. The Work Authorization reflects the terms for services offered by FDU to its customers and is described on pages 1 and 2, part I.1.4 of the "Master Services Agreement" between HECO and First Data Utilities ("FDU"), Attachment 2. Attachment 2 is a confidential document and will be provided upon the issuance of a protective order in this proceeding.

The estimated monthly rate and total costs for the months of June through December 2009 for these items was provided in the Company's response to CA-IR-113 and is as follows:

Expense Category	June – December 2009 (Per Mo.)	June – December 2009 Total
Postage	$107,500	$752,500
Bill Forms	10,078	10,078
Bill Envelopes	12,200	85,400
Payment Envelopes	6,450	45,150
Bill Print Outsourcing Fees	45,951	321,657
Total Expenses	**$182,179**	**$1,214,785**

Supporting documentation for the above amounts was provided in the Company's response to CA-IR-2, Attachment 2, pages 3 and 12.

Confidential Information Deleted
Pursuant To Protective Order, Filed on
_____.

CA-IR-223
DOCKET NO. 2008-0083
ATTACHMENTS 1-2

Attachments 1 and 2 contain confidential information and will be provided after a Protective Order is issued in this proceeding.

Attachments 1 and 2 are voluminous and available for inspection at HECO's Regulatory Affairs Division office, Suite 1301, Central Pacific Plaza, 220 South King Street, Honolulu, Hawaii. Please contact Dean Matsuura at 543-4622 to make arrangements to inspect the document. Electronic copies of the requested information will be provided.

CA-IR-244

Ref: HECO-1107 (HEI Forecast).

As discussed during the on-site interview on September 12, 2008, please provide the following information, in both hard copy and spreadsheet file formats:

a. Intercompany Bill Summary for 2007 using 2008 allocation percentages.
b. Calculation detail supporting the HEI labor rate.
c. Special overhead loading schedule showing components included in the calculation of the HEI labor rates.
d. Special studies:
   1. Lease study.
   2. Depreciation study.

HECO Response:

a. The Intercompany Bill for 2007 using 2008 allocation percentages is voluminous and contains confidential employee labor rates. It will be provided as Attachment 3 of this response after a protective order is issued in this docket.

b. Please see Attachment 1 for a sample template used for calculating hourly labor rates for employees. Labor rates are based upon actual labor costs for salary, benefits and payroll taxes and loadings are added onto labor costs for normal departmental costs. These costs include those with respect to office supplies, subscriptions, meetings and seminars, pension costs, computer costs, utilities, etc. There is no profit or premium component to the labor rates. The spreadsheet file is being provided as "CA-IR-244 Att. 1 & 2.xls."

   Due to the confidential nature of employee salary and benefit information, the actual loaded labor rate calculations for HEI employees are only available for review at the HEI Controller's office. Please contact Dean Matsuura at 543-4622 to arrange to review this information.

c. Please see Attachment 2 for the following loadings that are included in the labor rate calculations. The spreadsheet file is being provided as "CA-IR-244 Att. 1 & 2.xls."

1. Other human resources costs (Benefits E): primarily represents the allocation of human resources benefits administration costs based upon salaries
2. Copier/fax/file storage costs (Copier A): represents the allocation of copier, fax and file storage costs to all employees equally
3. Mailing services (Mailing A): represents the allocation of general mailing charges to all employees equally
4. Rent buildings (Rent A): represents the allocation of rent expense based upon square footage occupied by employee
5. HEI Corp info system expense (Info Sys A): represents the allocation of Information systems expense (i.e. depreciation and amortization of computer and related equipment along with the cost of HEI technical support employees) to all employees equally
6. Insurance (Insurance A): primarily represents the allocation of general liability and property insurance based upon square footage occupied, the allocation of crime, workers compensation and business travel insurance to all employees equally and the allocation of Directors and Officers insurance based upon the total number of directors and officers covered
7. Miscellaneous expenses (Misc): primarily represents the allocation of the shredder and copier space along with other miscellaneous expenses such as water and repairs to all employees equally

8. Depreciation (Depreciation A): represents the allocation of leasehold improvements and furniture & fixtures based upon square footage occupied

d. 1. Please see response to item c. 4. above for the "lease study" which represents the allocation of rent expense to each HEI employee based upon square footage occupied.

2. Please see response to item c. 8. above for the "depreciation study" which is the allocation of leasehold improvements and furniture & fixtures based upon square footage occupied.

	Total insurance	935,764	17,127	952,890	

	17,127
Insurance allocated by sq. footage ∑ (a)	18,415
Insurance allocated no. of employees ∑ (b)	2,786

NOTE: Allocation of HECO labor and overhead charges of $17,127 for insurance procurement purposes based upon premium dollars.

Total insurance per g/l	935,764
Svcs from HECO - Insurance	17,127
	952,891

NOTE: Due to the significant amount of movement by HEI employees in 2007, we will utilize the average of 1/1 and 12/31 square footage to allocate property related insurance expense.

* - Allocated based upon square footage.
General liability insurance covers any claims in excess of coverages already in place. Accordingly, since the majority of insurance costs relate to property we will allocate general liab ins prem based upon square footage.
** - Allocated equally to all employees.
*** - Allocated to only stock transfer employees.
(1) - Utilized L. Masutani's 1/1/07 sq. footage for K. Morimoto's average.

Tie-out of total space occupied for insurance allocation purposes to the HEI Corporate Rent Schedule

Total sq. ft:	1/1/07	12/31/07
King Street	8,219	4,908
